Biocentric theology

Christianity celebrating humans as an ephemeral part of life, not the centre of it

Rev. Jason John

Submitted in fulfilment of the requirements of the degree of Doctor of Philosophy, February 2005

12 REFERENCES ............................................................................................................. 42
Figure 1. One reconstruction of the human ancestral tree. For most of the span of what he think of as being ourselves, human beings, there were actually at least three species of humans, *H. sapiens; H. neanderthalensis* and *H. erectus*. *H. ergaster*, which may or may not overlap with *H. sapiens*, is considered by some to be the first human.

Figure 2. A consensus phylogeny of eukaryotes, according to Baldauf. The relationships look more like a top down view of a groundcover, than the tall, hierarchical trees, in which simple life forms were thought to give way to more complex ones. Animals are part of the opisthokonts, bottom left.

Figure 3. A history of marine invertebrate extinctions. Palaeontologists agree that there were at least five of the larger peaks represent mass extinction events on the entire Earth. The last peak represents the mass extinction event which brought the dinosaurs to an end. Note that this includes only the last 550 million years, before which the data are too sketchy.

Figure 4. Growth in number of genera over time, a very rough measure of diversity.

Figure 5. The evolution of the image(s) of God, based on the text in Baring and Cashford, *The Myth of the Goddess: Evolution of an Image*.

Figure 6. *Homo ergaster, neanderthalensis* and *erectus*.

Figure 7. *Homo ergaster*, from Zimmer, which he calls the earliest species to warrant the term human.

Figure 8. Sketch of the web of interactions of an ecosystem, from an American education web site (http://www.alligatorfur.com/education/web2.jpg), author unknown. The arrows show the flow of a resource from one element to the other. So humans hunt alligators, which eat raccoons, which eat berries, which need sunlight to grow.

Figure 9. A traditional tree of life, and a symbiogenic "mangrove."

Figure 10. The 'tree of life' from a symbiogenesis perspective. An "individual" animal or species such as a seagull is not the result of genetic mutations through a single line of common ancestors, but is largely the result of the merging of the DNA of several distinct species, and even kingdoms, at various points in evolutionary history.

Figure 11. Very simplified, conceptual evolutionary tree showing major extinction events. Adapted from annotated version by Grigg for his course, Oceanography 201, taught at the University of Hawaii.

Figure 12. Photo of a river retouched by an anonymous artist, and further modified by myself. It is the best illustration of some of the major features of evolution mentioned in this thesis; some tributaries rejoin (following Margulis & Sagan); only a small fraction of life that has existed persists in the present (top of diagram); the termination of some tributaries is associated with rapid expansion in others, as in mass extinction events; microbial life (the centre stream) generates the tributaries, and remains a significant force throughout time.

Figure 13. Figure from Ward & Brownlee, showing the short span of Earth history over which animals will exist in any significant numbers. Life will not go on gaining in complexity until the end of Earth, but will soon begin to become increasingly simplified, as oxygen hungry nervous systems become increasingly selected against.

Figure 14. The tributaries showing a possible full history of life on Earth, including the impending extinction of complex plants and animals, following the scenarios described by Ward & Brownlee.
2 Abstract

When the Uniting Church formed in 1977, its *Basis of Union* envisaged a final reconciliation and renewal for all creation, not just humans. It did, nonetheless, reflect the anthropocentric assumptions of its day, as did other official documents released in the first decade of the Uniting Church’s life. Anthropocentrism assumes that human beings alone are created in the image of God, charged with dominion over Earth\(^1\), and responsible for the fallenness of creation, though not necessarily through the actions of a literal Adam and Eve. This basic framework did not shift in the first decade, even though Earth began to be talked about not as an inanimate resource for human consumption, but something good and valuable in and of itself.

In 1990 this anthropocentric paradigm began to be challenged, and during 2000-2002 two quite irreconcilable understandings of the relationship between God and Earth, and thus humans and other animals existed side by side in Uniting Church worship resources.

Having listened carefully to the story of life as told by ecological and evolutionary scientists, I conclude that the traditional anthropocentric paradigm is no longer tenable. Instead I propose that *all of life* is the image of God, in its evolutionary past, ecological present and unknown future. *All of life* is in direct relationship with God, and exercises dominion of Earth. Evidence traditionally used as evidence of the fallenness of creation is instead affirmed as an essential part of life, though life on Earth has experienced a number of significant “falls” in biodiversity.

Even the more biocentric thought in recent Uniting Church resources is inadequate, because its language implies that life is simple, static, benign, and to

\(^1\) In this thesis I use the convention of referring to our planet as Earth, rather than earth or the earth. Some authors do this to imply that Earth is a subject, or even being. I do it simply because it seems more correct, it is the proper noun for this planet, just as I say I live in Australia, not the Australia. When quoting other authors I have retained whatever convention they used, for it is far too clumsy to change every reference.
some extent designed by God. In order to be adequately consonant with the life sciences, theology must be able to accept that finitude (pain, suffering and death) is a good part of creation, for without it there could be no life. This is an emphasis of ecofeminism, which I extend to affirm not only individual death, but the extinction of whole species, including humans.

I argue that the purpose of creation was not the evolution of humans, but to make possible God’s desire for richness of experience, primarily mediated through relationships. Whilst this idea is well established in process theology, it must be purged of its individualistic and consciousness-centric biases to be adequately consonant with the scientific story of life.

The resulting biocentric paradigm has several implications for our understanding of Jesus. I argue that he offers salvation from the overwhelming fear of finitude, rather than finitude itself. Against the trend in ecotheology, I propose that this saving work is directed in the first instance to humans only. I tentatively propose that it is directed to only some humans. This, paradoxically, is more affirming of God’s relationship with the rest of creation than most ecotheology, which proclaims Jesus as a global or universal saviour. Salvation for some humans, and all non human creatures, happens only in a secondary sense, because this is the only sense in which they need saving. I then speculate on whether and how it might be possible for a Christian biocentric community to live out its salvation.

Finally, I revisit the Basis of Union and argue that although the biocentric theology I have proposed goes well beyond the Basis, it is not at odds with the Basis’ directions and intentions. Biocentric theology is, rather, an extension of the trajectories already contained within the Basis, with its trust in the eventual reconciliation and renewal of all creation.
3 Declaration

I certify that this thesis does not incorporate without acknowledgment any material previously submitted for a degree or diploma in any university; and that to the best of my knowledge and belief it does not contain any material previously published or written by another person except where due reference is made in the text.

Rev. Jason John
4 Acknowledgments

Andrew Dutney is a highly sought after supervisor for a reason. Our meetings were always helpful, so much that it was possible to do most of the thesis by distance, which limited us to small blocks of meetings once or twice a year. His enthusiasm and ability to recommend useful resources were both consistent and invaluable. The decision by the Church to appoint Karen Moyle as Andrew’s personal assistant was a Godsend. Her high level of efficiency freed Andrew to put more hours into supervision, and her friendly and approachable manner made scheduling appointments with him a pleasure.

Stephen Downs generously agreed to be my supervisor for this thesis, before its shape changed so much that I shifted to Andrew, about which he was very gracious. He was an enthusiastic supporter of the Christianity after Darwin conference which I co-organised during the thesis.

Robert Bos agreed to be my co-supervisor for my time in Queensland, even while transferring jobs. His enthusiasm for the project was much appreciated and compensated somewhat for the sometimes lonely aspect of distance education.

Chris Daniels is an associate professor at the University of Adelaide, where he runs the Evolutionary Physiology laboratory. He read the first draft of the chapter on the scientific stories of life, along with some tentative theological reflections, and offered some very useful feedback, not least his enthusiastic encouragement about the value of the thesis itself.

Several other students - Cameron Freeman, Lorna Hallahan, Cheri Joy and Deidre Palmer - shared their wisdom with me in some of the tricky sections where I wondered if I was getting myself way off track.

I received my scholarship offer the week after Toni Lawson and I found out we were going to have a baby. Without her willingness to go through the dramatic reduction in income that resulted, this thesis would never have got off the ground.
Toni, and Fran John read advanced drafts of this thesis and offered feedback on the parts which needed to be reworked for the sake of clarity. Rob John provided some office space, which helped me sustain focussed work in the final months.

Beth Prior, Val Canty and Wendy Davis made the library a productive joy to visit, as did the people behind the document delivery service, whom I never met. I thank Beth and Val in particular for always looking like they believed me when I said that this would probably be the last book I was going to borrow.

I want to acknowledge the work of the eco-engaged theologians whom I cite in this thesis. I believe that it is simply the nature of a thesis, rather than some repressed oedipal nature of my own which leads me to emphasise what I perceive to be the gaps and discrepancies in some of their writing. If the Christian faith was to take up and implement the ideas of any one of them I would be ecstatic, and the world would be a much better place. For example, though I criticise Charles Birch’s writings on more than one occasion, the deep thoughtfulness and compassion he displayed during an interview some years back moved me to tears, and he has had a tremendously positive influence in the Uniting Church. The very existence of his books, before I read them, assured that there must be some hope that this new Christian thing I had signed up for would allow me to continue to live out my passion for life around me.

More trees than bear thinking about went into this thesis, along with all the organisms which rely on them. I hope to produce a more publicly digestible version of this thesis which might work against those who level forests to print their catalogues full of rubbish, and so in the long run actually save paper.

Finally, I acknowledge that this thesis finds me wanting. If my conclusions are at all correct, then I am very much in need of the kind of salvation I speculate about here. I am occasionally terrified that God might decide to save me in just these terms, like some modern day Job, though worse, because I asked for it.
5 Introduction

“This star, our own good earth, made many a successful journey around the heavens ere man [sic] was made, and whole kingdoms of creatures enjoyed existence and returned to dust ere man [sic] appeared to claim them. After human beings have also played their part in Creation's plan, they too may disappear without any general burning or extraordinary commotion whatever.”

Is this true? Most Christians would have difficulty saying yes. It flies in the face of the majority Christian tradition, which places Homo sapiens at the centre of creation, as a unique species with a divine mandate to exercise dominion over the creation, justified by reference to the Hebrew creation stories of Genesis chapters 1-3.

Does H. sapiens have an indispensable role in the world? Has the divine/human relationship irrevocably changed the relationship between God and all creation? Is humanity the centre of the story between God and all life? Or are we simply a part of the story - a very recent and perhaps dispensable part? In short, is the relationship between God and creation anthropocentric or biocentric?

From its inception the Uniting Church escaped some of the androcentrism (male centredness) of the wider church, accepting both women and men as ordained ministers. It was, however, thoroughly anthropocentric (human centred), as revealed in key documents like its Basis of Union, and the statement which it released to the Australian nation at its inauguration in 1977. In these documents the rest of creation, though important, was largely conceived as an impersonal resource for the use of humans.

In chapter 6 I trace the development in thought about the relationship between humans and the rest of creation in the Uniting Church. During the 1980s and 1990s, creation came to be recognised as being good in and of itself, and was

---

referred to occasionally as consisting of subjects, rather than being an inert object. *Homo sapiens*, however, remained fundamentally discontinuous in nature from other species. A more biocentric way of conceiving humanity’s relationship with the rest of creation emerged in the 1990s, disappeared for a decade, and then reappeared repeatedly from 2000-2003. Although the anthropocentric paradigm continued to be the most prevalent, some contributors to Uniting Church resources started to talk about humans as being part of the “web of life” - not just ecologically, but ontologically.

Ontology is the branch of metaphysics concerned with the nature of being. Ontological difference refers to a difference in the being of two or more things, rather than a difference of degree or function. It is the term used by Pope Pius XII, who typifies the anthropocentric approach, “With man [sic], we find ourselves facing a different ontological order— an ontological leap, we could say.” Biocentric thought rejects this dichotomy. We therefore have two irreconcilable paradigms of the relationship between humans and the rest of creation, and the way in which God relates to creation. Yet both paradigms coexist in Uniting Church resources without any attempt to name, let alone judge between, them. In this thesis I do both.

The nature of the relationship between humans and other species is not only a theological question. The life sciences have, on the basis of masses of data, a number of theories as to the relationships amongst species, including humans. The relationships are measured in numerous ways, from the ecological relationships of resource use, to the genetic relationships across species which point to our common ancestry. The findings of the life sciences may, therefore, help answer the theological question. But how can theologians use scientific data? What is the relationship between science and theology?

---

In chapter 7 I review the ways in which theology approaches the sciences in different traditions. I argue that the Uniting Church is a church committed to dialogue, or perhaps more accurately to integration of scientific knowledge into theology. Integration is the task of making theological propositions consistent with contemporary scientific knowledge, even if they are not directly derivable from science. It is the quest for theological consonance with science. Having established that the Uniting Church commits us to dialogue, I look in more detail about how that dialogue might proceed in the Uniting Church tradition.

The Uniting Church claims a place for itself firmly within the wider church. It envisions the whole church as a pilgrim people, always open to reform. This pilgrim journey is guided by landmarks, especially the biblical witnesses and church tradition. How we use these landmarks, and what they mean for us today is open to revision in the light of contemporary experience and reason. I illustrate how this works in the Uniting Church using the case studies of the ordination of women and ongoing discussions about sexuality. I conclude that Uniting Church theology cannot be defended by biblical or traditional fundamentalism or literalism.

We must, therefore, listen as attentively as we can to the science story, and imagine the possibilities for making theology consonant with it. In chapter 8 I review the story of life as told to us by evolutionary biologists and ecologists, briefly set in the context of cosmology. Although I try as far as possible to let the scientists tell their own story, theologically we will be interested to hear what they have to say about our relationship with other creatures, and the ways, if any, in which God may relate to life on Earth.

In chapter 9 I attempt to evaluate this information theologically. I conclude that the traditional anthropocentric arguments do not adequately integrate or achieve consonance with the scientific data we have. Even the more biocentric elements, found in the Uniting Church resources and amongst contemporary theologians, are considerably lacking. At times the more biocentric theologians fail to follow through on the logic of their own proposals, retreating to more familiar anthropocentric assumptions at crucial points. There is also a tendency, because
of the reliance on the web of life model, to imply that life is simple, static benign, and to some extent designed by God. I therefore make a series of judgments about which parts of the biocentric paradigm seem to be the most consonant with science, and how they might be made more consistent with each other.

The biocentric theology I begin to outline is one which affirms biological finitude, including death as good, and a spiritual afterlife as improbable and difficult to envisage in any meaningful way. Life is seen to be devoid of any progression towards *Homo sapiens*, or even consciousness. Rather God’s purpose in creating the universe was to experience richness of relationships which relies on the whole diversity of life in all its evolutionary pulses, and in which humanity and consciousness hold no privileged place. The result is a theology which has elements of process thought, but from a more biocentric perspective which does not privilege individual consciousness, a kind of biocentric process theology.

In chapter 10 I begin to spell out a biocentric framework, or vision, for Christology and ethics. I start by asking what advantage there is to humans in seeing God through this finitude and contingency filled life in which we exist. Having concluded that only this vision of God is a true vision, I go on to explore what this says about Jesus of Nazareth, long understood also to be the image of the invisible God. I discuss how we should conceive of his ethical call to Christians in the context of our evolutionary history. Though ecofeminist theology has much to offer because of its acceptance of finitude, I differ from its assumption that Christian ethics is somehow counter-evolutionary. Instead, I argue, Jesus’ vision makes sense given our evolutionary past, in certain circumstances. I explore what those might be, and how likely they are to occur. Where, in other words, might Christian ethics actually work?

Finally I test the consonance of the version of biocentric theology I have proposed with the *Basis of Union*. Although the drafters of the *Basis*, and those who voted to accept it, were certainly not biocentric, I argue that biocentric theology represents an extension of trajectories already present in the document, especially because of the ecological and evolutionary motifs I find within it. Biocentric theology is consonant with the *Basis* though it extends it significantly. It is
therefore legitimate for members of the Uniting Church to explore biocentric theology within the Uniting Church, even though it will lead them to novel conclusions about what it means to hope for the final reconciliation and renewal of all creation.
6 Anthropocentric and biocentric thinking in the Uniting Church

An alternative to traditional anthropocentric assumptions about the relationship between God, *H. sapiens* and other life on Earth has emerged. In this chapter I present an historical overview of this phenomenon within the Uniting Church. Some of the documents I refer to are official policies and pronouncements by the Uniting Church’s National Assembly, the body which has doctrinal authority.5 From the 1990s onwards there is a shift towards education rather than proclamation in the Uniting Church, so the relevant material is relocated to worship resources and educational materials, mostly produced by the Assembly’s Social Justice Agency (currently called UnitingJustice).

This material is prepared for use in the church, but has no doctrinal authority. This is not a serious limitation for, as we shall see, the Uniting Church is not the sort of church which would attempt to make a doctrinal pronouncement on an issue like the relationship between humans and the rest of creation. I also mention relevant resolutions passed by the Synods to fill out the picture a little more, though in Uniting Church polity these are considered guiding statements without doctrinal authority. Before reviewing the literature, it is necessary to explain in more detail what I mean by anthropocentrism and biocentrism, since the terms have various meanings and uses in theology.

6.1 Anthropocentrism and biocentrism defined

6.1.1 Anthropocentrism

“… we are a spirit made in the image of God; an incorruptible picture of the God of glory; a spirit that is of infinitely more value than the whole earth...(John Wesley)6”

---

Theological thinking about the relationship between humanity and the rest of creation exploded after the publication of an article by Lynn White, which claimed that,

“Especially in its western form, Christianity is the most anthropocentric religion the world has seen.”

By this he meant that Christianity teaches that humanity shares, “in great measure,” God’s transcendence of nature, and that “it is God’s will that man [sic] exploit nature for his proper ends.” Anthropocentrism means, literally, putting humanity at the centre. John Passmore showed that anthropocentrism has a variety of expressions, even within Christianity, from the despotism which White attacked to more conservationist minded approaches. The latter form a cluster of minority traditions, which a flurry of theological responses to White sought to resurrect, primarily by claiming that humans were called to be stewards of “nature.”

It was claimed that stewardship cast humanity in a benevolent rather than malevolent role in creation. Yet earlier proponents of dominion did not see themselves as acting malevolently. Peter Harrison points out that what we now call exploitation, seventeenth century thinkers called restoration. To their mind, all creation had fallen with humanity. The ground itself was cursed because of Adam (Genesis 3:17). By subduing Earth, for example through agriculture, humans returned it to something resembling the Garden of Eden, which was, quite literally, a garden. As Harrison puts it,

“…early modern discourse about human dominion is not an assertion of a human tyranny over a hapless earth, nor does it exemplify an arrogant indifference to the natural world. Rather, dominion is held out as the means by which the earth can be

\footnotesize
\begin{itemize}
\item[8] Ibid.
\item[10] Passmore argues, rightly, that humans as stewards of nature does not really constitute an ancient tradition in Christian thinking, though there were various alternatives to outright despotism. (Ibid, pp. 28-39.)
\end{itemize}
restored to its prelapsarian order and perfection. It is for this reason that the seventeenth-century discourse of dominion is almost invariably accompanied by a rhetoric of restoration.\textsuperscript{11}

According to Harrison, “Dominion, then, was not exercised so that humanity could leave its mark upon the earth… it was to erase those scars which embodied the physical legacy of a moral fall.” The aim was to restore creation to its “original perfection.\textsuperscript{12}” At the same time, the growing acceptance in the church of the Copernican hypothesis\textsuperscript{13} undermined the idea that the universe was created for humanity. The place of \textit{H. sapiens} in the universe was shrinking.

Humanity was decreasingly an all powerful ruler of the cosmos, and increasingly a small community in a hostile and indifferent world. Harrison believes that anthropocentric convictions, at least amongst church members actively engaged in the pursuit of the sciences, were waning,

“Whatever the past glories of Eden… the present world was no longer regarded as the place over which human beings exercised a natural superiority, nor did the earth compliantly … provide for the material comforts of its human tenants. It was not arrogance, but modesty that motivated the first of the modern scientists, and their program was not the violation of nature but the restoration of the earth to a paradise in which all creatures could take their proper place.\textsuperscript{14}”

He concludes therefore that,

“…the common assumption that anthropocentrism is one of the engines that drives the exploitation of nature now seems questionable.\textsuperscript{15}”

In terms of the sort of anthropocentrism Harrison is describing- the claim of human superiority over other animals- his point is well made. This is not,

\textsuperscript{12} Ibid: p. 104.
\textsuperscript{13} That the sun, rather than Earth, was the centre of the universe.
\textsuperscript{15} Ibid: p. 107.
however, the most fundamental or theologically interesting form of anthropocentrism in Christian history. Harrison himself, in the previous quotations, implicitly and apparently unconsciously attests to a more important anthropocentrism, one which his subjects are fully enmeshed in.

It is precisely in assuming that creation is fallen on account of the action of Adam and Eve, in believing that ‘wilderness’ ought to be gardens providing for human consumption, and in assuming that restoration is about a return to a garden, that we see the theological expression of the most fundamental anthropocentrism in Genesis and its interpreters. Although human arrogance (hereafter called shallow anthropocentrism), may have diminished as Harrison claims, the “deep anthropocentrism,” which sees humanity as central to the entire relationship of God to Earth, if not the universe, remained, and remains.

Deep anthropocentrism remains unchallenged by the stewardship model. For this reason, attempts to rehabilitate Christian theology by moving from an emphasis on domination to stewardship achieve little theologically. As Harrison says,

“… the role played by the narratives of creation and fall in the seventeenth-century discourses of the domination of nature suggest that the long-standing distinction between the traditions of “stewardship” and “despotism” in the Western tradition may have outlived its usefulness.”

Joseph Bush agrees, claiming that stewardship is simply a “kinder form” of dominion than mastery. The same may be said of other attempts to soften the notion of dominion without rejecting its deep anthropological assumptions, and hierarchical dualism, such as replacing steward with “guardian” and “custodian.”

16 Ibid.

One assumption of deep anthropocentrism, the sort which this thesis examines, is that *H. sapiens* is ontologically distinct from all other species, whatever their biological similarities. This is built on the observation that, in the Genesis creation stories, *H. sapiens*, and only *H. sapiens*, is created in the image of God, and animated by the Spirit of God at creation.

The second assumption, also grounded in Genesis, is that *H. sapiens* is at the centre of the story of God and life. Humans are given a divine mandate to dominate (or care for) the rest of creation. When the divine/human relationship sours, the relationship between God and all life sours- Earth is cursed through human activity (Genesis 3:13-19), and waits to be redeemed in and through God’s redemption of humanity (Romans 8:19-23). This is the third key anthropocentric assumption, the “Fall” of humanity into/via Original Sin, and the subsequent cursing of all creation. The histories of the doctrine of the Fall, and the related doctrine of original sin, have recently been well documented by the likes of Jerry Korsmeyer, Paul Santmire and Tatha Wiley. Both doctrines, and the historical basis of Genesis, are assumed in the Reformation Witnesses to which the *Basis of Union* refers; the Scots Confession, Heidelberg Catechism, Westminster Confession and Savoy Declarations. Wesley, too, took both doctrines for granted. In Catholicism the doctrine continues to be defended in

---

20 Genesis 1:26-27; 5:1; 9:6. This flows through to the New Testament, eg 1 Corinthians 11:7 (of men only, not women); James 3:9. In some New Testament witnesses, Jesus the Christ takes over the image of God from humanity as a whole, eg 2 Corinthians 4:4; Colossians 1:15. Humans regain the image by entering the Christian community (eg Romans 8:29; 1 Corinthians 15:49; Colossians 3:10).

21 Genesis 2:7. Ecclesiastes 3:19 is a notable rejection of this.

its traditional form. All that we need to note here is that the doctrine of the Fall reaffirms the centrality of humanity in the story of God’s relationship to all creation. All creation is caught up in humanity’s failure to have the sort of relationship with God that God desires. As Genesis 3:17 puts it,

“And to the man [God] said, "Because you have listened to the voice of your wife, and have eaten of the tree about which I commanded you, 'You shall not eat of it,' cursed is the ground because of you…”

A different type of anthropocentrism needs to be mentioned, because there is a marked shift in thinking about it in the Uniting Church material. Ethical anthropocentrism is the assumption that human needs should be at the centre of ethical decision making. Extreme ethical anthropocentrism limits ethical concern to humans alone, and is seen in early Uniting Church documents. I will refer to this as ethical anthropoexclusivism. This gives way to a milder version, in which ethical concern is extended to other animals for their own sake, but still with human concerns being the most important.

Stewardship theology, whilst still deeply anthropocentric, usually rejects anthropoexclusivism. It recognises that other species are loved by God, and have at least limited rights. Usually, however, the rejection of anthropoexclusivism is justified through deep anthropocentrism. For example, when the World Council of Churches met in Canberra with a focus on renewing the whole creation, the bible studies stated that humans were those,

“…with whom God has a special relationship and on whom is laid the responsibility to care for and preserve the earth.”

Despite the fact that stewardship theology does at least suggest some commitment to the well being of other life forms, it is not enough for a growing number of

---

28 I apologise for the mouthful, but it is less tedious, and more adequate, than “extreme ethical anthropocentrism.”

29 Anonymous, *Come Holy Spirit: Renew the Whole Creation* (Melbourne: Joint Board of Christian Education, 1989), p. 44. Even if stewardship was rejected at the WCC, it remains the dominant metaphor in worship resources produced by the Uniting Church Assembly.
humans when they think about their place in creation. Often through sustained
engagement with the rest of creation, and especially environmental activism, they
have come to reject both ethical and deep anthropocentrism, and to start learning
to think biocentrically. This influence is beginning to make itself felt in the
Uniting Church.

6.1.2 Biocentrism

Biocentrism literally means life centred. As with anthropocentrism, its uses vary
amongst authors. Ian Barbour, for example, uses it in a very narrow sense. He
claims that biocentrism values ecosystems whereas process thought, of which he
is an advocate, values individuals. Other process theologians, however, see their
work as being biocentric. Charles Birch argues that process theology leads us
towards a more biocentric world view, and explores a theological foundation for
a more biocentric ethic. So too Jay McDaniel hopes that more people will take a
biocentric approach to life. By this he means that people will be respectful of
life, recognising that other animals are our neighbours, and worthy of reverence.
Although humans might be the most valuable forms of life, we cannot draw a
sharp line between ourselves and other animals. We should be biocentric,
according to McDaniel, because God is.

---

36 Ibid, p. 73.
37 Ibid, p. 52.
Yet as we shall see this form of supposed biocentrism still has humans at the centre, of ethical concern at least. Reverence for life is expanded to include all life, but it is still basically expanded around humans.

Other advocates of biocentrism remove humans from the centre. They are truly life centred. John Muir, for example, emphasises the peripheral place of human persons on Earth. The quote at the beginning of this thesis was written during his one thousand mile walk across America observing the natural world, which he began in 1867. His reflection is worth reproducing at some length,

“The world, we are told, was made especially for humans - a presumption not supported by all the facts. A numerous class of people are painfully astonished whenever they find anything, living or dead, in all God's universe, which they cannot eat or render in some way what they call useful to themselves. They have precise dogmatic insight into the intentions of the Creator… He is regarded as a civilized, law-abiding gentlemen in favour either of a republican form of government or of a limited monarchy…

But if we should ask these profound expositors of God's intentions, How about those animals - lions, tigers, alligators - which smack their lips over raw human flesh? Or about those myriads of noxious insects that destroy labour and drink our blood? These are unresolvable difficulties connected with Eden's apple and the Devil. Why does water drown its ruler? Why do so many minerals poison us? Why are so many plants and fishes deadly enemies? … Oh, [they say], all these things are satanic, or in some way connected with the first garden.

Now, it never seems to occur to these far-seeing teachers that Nature's object in making animals and plants might possibly be first of all the happiness of each one of them, not the creation of all for the happiness of us… The universe would be incomplete without us; but it would also be incomplete without the smallest transmicroscopic creature that dwells beyond our conceitful eyes and knowledge.

This star, our own good earth, made many a successful journey around the heavens ere we were made, and whole kingdoms of creatures enjoyed existence and returned to dust ere we appeared to claim them. After human beings have also played their part in Creation's plan, they too may disappear without any general burning or extraordinary commotion whatever.

…venomous beasts, thorny plants, and deadly diseases of certain parts of the earth prove that the whole world was not made for us. When an animal from a tropical climate is taken to high latitudes, it may perish of cold, and we say that such an
animal was never intended for so severe a climate. But when we betake ourselves to sickly parts of the tropics and perish, we cannot see that we were never intended for such deadly climates. No, we will rather accuse the first mother of the cause of the difficulty, though she may never have seen a fever district; or will consider it a providential chastisement for some self-invented form of sin.  

His attitude sits well with that of Aldo Leopold, who in 1949 characterised humans as, “plain members” of the biotic community.

Deep ecology is a biocentric movement which promotes a “transpersonal” view of life. Where McDaniel and Birch appear to stretch the concept of value and rights from humans to other beings, deep ecologists like Warwick Fox are more interested in advocating the realization of a certain state of being, of widening the sense of self so that “nature” is seen to be part of the self, and the self part of “nature.” As John Seed, another well known Australian advocate for Deep Ecology put it,

“The human is no longer an outside, apart. Your humanness is then recognized as being merely the most recent stage of your existence, and as you stop identifying exclusively with this chapter, you start to get in touch with yourself as mammal, as vertebrate, as a species only recently emerged from the rainforest. As the fog of amnesia disperses, there is a transformation in your relationship to other species, and in your commitment to them… ‘I am protecting the rainforest’ develops into ‘I am part of the rainforest protecting myself. I am that part of the rainforest recently emerged into thinking.’

My own use of the term biocentric in this thesis is constructed in antithesis to the deep anthropocentrism I have already discussed. It removes humanity from the centre of the story of God’s relationship with creation, claiming that God relates directly to life, the bios, not to life via H. sapiens. It rejects the claims that humans alone are in the image of God, charged with dominion over the rest of life on Earth, and that through human action the very nature of creation has been altered into some kind of fallen state.

As stated in the introduction, hints of this biocentric thinking emerged in the Uniting Church in 1990, at the time of the World Council of Churches, *Come Holy Spirit, Renew the Whole Creation* meeting in Canberra. It reappeared in 2000-2002, though stewardship is still the dominant model. Where it does appear, it appears to emerge more from the lines of thinking of Birch, McDaniel, Muir and Leopold than Fox and Seed.

To trace this development we need to begin in 1977, when the Uniting Church came into being as a deeply anthropocentric community which was ethically anthropoexclusive.

### 6.2 Chronology- from anthropocentrism to biocentrism

#### 6.2.1 The *Basis of Union* and *Statement to the Nation*

The *Basis of Union* is the document upon which the founding denominations of the Uniting Church agreed to go forward on mission together, after some twenty years of negotiation. It continues to be an authoritative document in the Uniting Church today and therefore its propositions about the rest of creation are significant.

---

44 The exact status of the *Basis* is discussed further on page 42.
The *Basis* places creation at the heart of God’s mission,

> “God in Christ has given to all people in the Church the Holy Spirit as a pledge and foretaste of *that coming reconciliation and renewal which is the end in view for the whole creation*. The Church’s call is to serve *that end*.\(^{45}\)

Andrew Dutney claims that, “there is no making sense of the *Basis of Union* or the Uniting Church without taking the end of the world with the utmost seriousness.” But this ‘end’ is not a literal, apocalyptic end,

> “… this isn’t the scorched-earth version of the end of the world… It’s the end of the world which we come to anticipate by looking at the ministry, death and resurrection of Jesus- the Healer, the Mediator, the Reconciler, the Life Giver, the one in whose name we expect the coming of ‘reconciliation and renewal…for the whole creation’ *and nothing less* (emphasis his).\(^{46}\)

This is supported by the first section of the *Basis*, which looks with hope to the day when, “… the kingdom of this world has become the kingdom of our Lord and of the Christ, who will reign for ever and ever.” The hope is, in other words, for a transformation, not a replacement, of Earth.

The *Basis* is, however, deeply anthropocentric. The *Basis* assumes that those who are estranged from God and in need of reconciliation fall into three distinct categories: Christians, other humans, and the rest of creation. Christians are separated from other humans because they are possessed by the Spirit of God,

> “[the Uniting Church] confesses that Jesus is *Head over all things*, the beginning of a new creation, of *a new humanity*. God in Christ has given to all people *in the Church* the Holy Spirit… (emphasis mine).\(^{47}\)”

---

\(^{45}\) Uniting Church in Australia, *Basis of Union* : As Approved by the Congregational Union of Australia (1973), the Methodist Church of Australasia (1974) and the Presbyterian Church of Australia (1974), for the Formation of the Uniting Church in Australia, (Melbourne: Uniting Church Press, 1992), section 3.

\(^{47}\) Uniting Church in Australia, *Basis of Union*, section 3.
Not only that, the work to which the *Basis* calls the church in the present is ethically anthropoeclusive. Section 14c speaks of a diaconate in which men and women work, “on behalf of God’s people, in the service of humanity.” This is echoed in the *Statement to the Nation* which was released at the inaugural Assembly of the Uniting Church in 1977. It describes the “environment” as a depersonalised, inanimate resource to be used by humans,

“We are concerned with the basic human rights of future generations and will urge the wise use of energy, the protection of the environment and the replenishment of the earth’s resources for their use and enjoyment (emphasis mine).”

The Constitution of the Uniting Church also reflected this attitude, describing the mission of the church as the call to assist in human development, improve human relationships and meet human needs.

So, at union the Uniting Church was anthropoeclusive: the environment was there simply as a resource for humans. Despite the eschatological hopes for a renewed creation, in the present a clear distinction between humans and the rest of creation was assumed. This attitude was slow to change in the life of the church, as the next decade, despite being a time when concern for the environment was near the forefront of public issues, would show.

Uranium mining and alternative energy sources dominated the Uniting Church’s early thinking about environmental issues at both the Synod and Assembly level. Victoria, and to a lesser extent Western Australia, investigated the practical implications of alternative energy sources at length in their Synod resolutions.

---

49 Uniting Church in Australia, *The Uniting Church Is Australia Constitution*, section 4.

The Northern and Victorian Synods engaged with the uranium issue in a series of long resolutions.

There is no theological reflection on the nature of the relationship between humanity and the rest of creation in these Synod resolutions, which assume a deep divide between humanity and a more or less inanimate ‘resource’. There is one notable exception.

### 6.2.2 Aboriginal Opposition to Uranium Mining 1977

From the inauguration of the Uniting Church some, at least, did see Earth as more than a resource for humans to share amongst themselves. In 1977 the Northern Synod’s Aboriginal delegates opposed uranium mining on the following grounds,

(a) “We are deeply concerned about the damage it will have on our mother land and to her children the Aboriginal people.

(b) We strongly believe that the land is part of our being, it is within our bones. Digging our land is also digging something that is within us.

(c) We are deeply concerned that our sacred areas are going to be destroyed…”

This is a Synod, not an Assembly, resolution, so it does not represent a doctrinal position of the Uniting Church as a whole. Even more narrowly it represents the view of the Aboriginal delegates, not necessarily the whole Synod. It would be ten years before the Assembly began to affirm the sacredness, or value, of all creation, and twenty five years before it began to consistently speak of humans and the land in relational terms.

### 6.2.3 Nuclear issues in the wider church 1982-1985

At the Assembly level, the wider church relied heavily on the deeply anthropocentric stewardship model. The 1985 Assembly affirmed that,

“God has given to humankind a unique place in creation. While part of the creation, people have at the same time been charged with dominion (Gen 1:28); which is to cultivate and guard (Gen. 2:5).”

---

51 Northern Synod resolution 77.37.1

52 Uniting Church in Australia, "Minutes of the 1985 Assembly" (1985), p. 160 (appendix 1).
Yet there is a real tension between claiming to be part of creation, and set apart to have dominion. This is exacerbated by the accompanying affirmation that humans alone are created in the image of God, and the assumption that humanity’s care for Earth is for the benefit of the present generations of humans, and their descendents\(^\text{53}\).

The following year an educational resource which targeted nuclear testing in the Pacific was released. This also adopted the stewardship model, on the basis that humans are created in the image of God\(^\text{54}\). Significantly, however, there is a shift away from anthropoexclusivism. Humans, as stewards, are called to care for the universe\(^\text{55}\)! One can hardly think of a more onerous task, nor imagine how we were ever meant to do it, but nonetheless we witness a move away from anthropoexclusivism. This shift finds expression in Assembly policy two years later.

### 6.2.4 Assembly Statement to the Nation 1988

A decade after the Uniting Church formed, the Assembly released its second *Statement to the Nation*. About ninety percent dealt with human justice, especially for Aboriginal Australians, and promised to participate in working for that justice. In that context, the 1988 Statement initially reiterates the extreme ethical anthropocentrism of the 1977 Statement, in its concern only for human need, and assumption that the rest of the world is a resource,

> “We recognise a widening gap between the rich and the poor, not only within Australia, but within the whole *human community*. We will strive to uphold *the rightful claims of the poor on the resources of this nation and the world*. We will seek to identify and challenge all social and political structures and all human attitudes which perpetuate and compound poverty (emphasis mine).\(^\text{56}\)”

\(^{53}\) Ibid.

\(^{55}\) Ibid.

\(^{56}\) Uniting Church in Australia, "Statement to the Nation," (1988).
The penultimate paragraph, however, begins with a theological first in Assembly and Synod declarations about creation,

“We affirm our belief that the natural world is God’s creation; good in God’s eyes, good in itself…”

The ‘natural world’ has a relationship with God which is good without reference to humanity, reiterating the five-fold affirmation of creation’s goodness in Genesis 1:10-24. The paragraph continues by affirming that creation is,

“...good in itself and good in sustaining human life. Recognising the vulnerability of the life and resources of creation, we will work to promote the responsible management, use and occupation of the earth by human societies. We will seek to identify and challenge all structures and attitudes which perpetuate and compound the destruction of creation (emphasis mine).”

Note that a strong distinction between humanity and ‘creation’ is maintained. The natural world is other than humanity. Humans are to manage and use and occupy Earth. They are to act on it and fill it rather than be a part of it. The Assembly remains in a stewardship paradigm, though clearly widening its ethical concern. It also opens the door a crack to biocentrism, recalling the biblical affirmation that creation was good and valuable before humans arrived, and remains so. This declaration of the value of creation reflects the influence of Charles Birch and his emphasis on intrinsic value, about which we shall see more later.

Birch was somewhat of a mentor for Andrew Dutney, who wrote the 1988 Statement. The final paragraph reflects the influence of Birch, Sean McDonagh (who visited the campus where Dutney worked as a chaplain), and Fox, a friend of Dutney’s who was also mentored by Birch. It is fair to say, then, that this “theological first” is not something which emerged out of the consciousness of the whole Assembly. Nonetheless, Dutney’s draft received minimal editing by the

57 Ibid.
58 Ibid.
59 Andrew Dutney, 18 November 2004. The details of the following paragraph come from the same conversation.
Assembly Standing Committee, and was approved by Assembly as something which adequately communicated its views to the nation. It was a bold communication, a call to action- to challenge, strive, identify and defend. It was a communication whose time was passing, in the Uniting Church at least.

Church agencies did continue to censure the government on various environmental issues, and commit to internally focused, pragmatic undertakings to become more ‘environmentally friendly’. But there was a tendency to move away from direct engagement of the public and towards education of church members, largely because of ongoing disquiet amongst church members about being, “spoken for.” For example, Jill Tabart reflected on this at the conclusion of her presidency of the Uniting Church,

“From outside the [Uniting] church time and again come admiring comments about the Uniting Church’s record and stance in these matters of opposition to social evils. And yet it would be the biggest area in which members of our church are critical of what the church is doing on their behalf and in the name of the Lord.”

John Harrison, reflecting on the first decade of the Uniting Church, affirmed that there had been,

“…much… concern expressed by the church members about the decisions of church councils during the first ten years… it seems clear that the political conservatism of the majority of the lay membership of the church has moderated the way in which the church approaches questions of social justice... Synod and Assembly social justice committees have moved to a more educative and consultative mode.”

This shift towards internal education is made explicit in the report to Assembly of the Commission for Mission in 1991. The report commented on the ethos behind

---

60 National Social Responsibility and Justice, Social Justice Resolutions. The various social responsibility agencies also worked behind the scenes with government and a number of companies accused of environmental irresponsibility.

a worship resource, *Healing the Earth*, which the Commission produced for the church in 1990. *Healing*,

“… represented not just a new work on the environment, but a new way of dealing with issues… *more an invitation to struggle with the issue than a stated position* (emphasis mine).”

So it is that most of the theological statements pertaining to the environment from 1990 onwards are found in worship resources, most of which were produced by UnitingJustice (formerly Assembly Social Responsibility and Justice).

### 6.2.5 Social Justice Sunday 1990- Healing the Earth.

Reflecting the new educational ethos, *Healing the Earth* introduces itself as,

“…an invitation for the reader to explore the meaning of the Christian faith in the light of the present environmental crisis.”

The bulk of the material is a description of the nature of that crisis, and suggestions of practical responses to it. A number of cartoons, poems and personal reflections from a diversity of contributors appear throughout the document. Although the document purports to explore both ethics and theology in the light of the “present ecological crisis,” only about six pages of the forty-two are devoted to theological reflection, “What help does our faith offer us… to make sense of this new challenge which is facing us?”

The reflection begins by reminding its readers that, “God is not to be equated with anything in the world, and certainly not with nature.” Yet God is nonetheless intimately acquainted with the world, “God is in, with and under the earth- not in

---

65 Interestingly, there is nothing about population control, nor have I found anything in any other Uniting Church material.
the pantheistic sense, but in the sense of the mystery of the eucharist.” This eucharistic concept is further developed when *Healing* reminds its readers that each celebration of the eucharist includes the call to praise God, “with the faithful of every time and place, joining with choirs of angels AND THE WHOLE CREATION (emphasis theirs).*

On this basis it claims that,

> “If we take this call to praise seriously, every time we celebrate the eucharist we are affirming that the whole of life, and all creation, is woven together. The universe is one. All is inter-related and bound together. All things are connected…we join not only the whole inhabited earth, but the whole creation in a cosmic hymn of praise…”

*Healing the Earth* continues on the theme of eucharist,

> “We place ‘the elements’ on the Lord’s table as symbols of the whole creation for which we ask God’s blessing… It is for all people and the whole creation that we ask God’s blessing. It is not a ‘private’ blessing that we ask for the life of the Church…not only…the bread and wine are affected by the action of the Holy Spirit; the Spirit blesses the whole creation which they represent.”

Yet the Uniting Church’s liturgy, as found in its official worship resource, states that the elements are, “the gifts of God, for the *people* of God,” a refrain I have heard without fail in celebrations of the eucharist. *Healing* does not explore the changes which may need to be made to our liturgy in response to its claims. Should we replace references to ‘people’ with ‘creation’? Or do we reinterpret people to mean not just *H. sapiens*, but other life forms? This is the approach

---

69 Ibid, p. 36.

70 Ibid.

71 Ibid, p. 38.

72 Hugh McGinlay, ed., *Uniting in Worship: Leader's Book* (Melbourne: The Joint Board of Christian Education, 1988). This resource was produced by the Commission on Liturgy. Of its authority the book says, “Its services and resources are not required to be used. Ministers… have the right to use other books, provided that these conform to the doctrine of the Uniting Church. On the other hand, *Uniting in Worship*, with the approval of the Assembly behind it, sets a standard for worship. It is normative in that it sets a standard against which other services may be measured… UIW is not itself an authoritative statement of the church’s doctrine… However the Commission has been guided by the doctrinal standards of our denomination. (pp. 8-9)”
advocated by Alfred Whitehead, and commonly expressed in North American First Peoples’ theology, as we shall see on page 42.

If the eucharist is not a ‘private’ blessing for the church, are other creatures welcome to share in the elements? If not, how are they blessed? Whether through lack of space, lack of appreciation of the profundity of the issues raised, or a desire not to alienate its readers, Healing does not explore these questions. In chapter 9, this thesis does.

Healing claims that all creation is, “woven together” since all creatures sustain and enrich each other in an interdependent relationship. Healing further acknowledges that,

“…there has often been too little awareness of the web that holds life together… the denial of the web of life that binds the whole created universe together, sustained by the Spirit of God… everything is intimately related. The earth is a finely woven web, and disturbance in one place has an inevitable impact on some other place.”

Moreover, Healing makes various claims about the nature of this web, which is seen to be perfectly, lovingly designed, and thus benign to the creatures which form it,

“We believe in God… who spun a web of shimmering life, where creatures grew and changed… Each needing all the others, held in delicate kinship. We believe in God… who patiently provides for each according to their need. Who blankets the drowsy wintering spider with warm earth so she may go about her business in the springtime… God calls us as the church to love the earth, to live humbly in the web of relationship, to announce the new wilderness.”

“The delicate, life-sustaining, inter-dependent nature of the world is a gift from God; it is a cause for rejoicing and adoration and praise.”

---

73 Meister Eckhart, cited with approval but without bibliographic detail (Assembly Social Responsibility and Justice Committee, “Healing the Earth,” p. 8.)

74 Ibid, p. 9…2…26 respectively.

75 An Affirmation of Faith (Ibid, p. 31.)

76 Ibid, p. 36.
Healing asks,

“Why does it matter if an insect, a plant, or a bird disappears forever? It matters because each one is a creature who belongs to God. It matters because whenever the diversity of life is reduced the world becomes a poorer place.77”

Healing affirms not just the interconnectedness of creation, but its worth to God, independent of its worth to *H. sapiens*. Reiterating the theology of the 1988 Statement, Healing affirms that,

“Creation has value because of its relationship to God. Creation is good, and does not need our improvement for it to be valuable…78”

Yet this stands in stark contrast to other sections of Healing, which explicitly assume that humans do need to improve creation, and stand apart from it,

“Genesis 2:15 gives humankind the role of cultivating and caring for the earth,79 … Scripture reminds us… that we are both to cultivate and care for the earth… [we have a] responsibility to care for the earth.80 … Nature is… a companion for human sustenance.81”

Healing reinforces the difference between humans and other creatures when it distinguishes between, “…human beings and… the natural habitat82 …people and the earth.83” An earth which requires cultivation necessarily requires improvement from its pre-human state.

77 Ibid, p. 15.

78 Ibid, p. 25. On page 28 Healing goes as far as to affirm that, “It is time for the church to reaffirm the goodness of animal and human manure.”

79 Ibid.

80 Ibid, p. 29.

81 Ibid, p. 25.

83 Ibid, p. 23.
How does Healing engage with the biblical witnesses? Its description of, “the Bible” certainly appears to conform to the understanding laid out in the Basis as we shall see in chapter 7.7,

“[The Bible is] the record of stories told by various communities of people as they made sense of life and their experiences of God… not an abstract book of universal philosophical truths, but a many faceted story of people’s efforts to make sense of life through faith in God.”

Despite this, however, Healing does not engage in a critique of those stories and the “philosophical truths” they seem to promote, either in the light of contemporary scientific thought, or even its own commitment to live, “humbly in the web of relationship.” For example, Healing assumes the biblical version of the human mediated fall of the, “animals, plants and soil,” without question. Healing did not break free of the theological assumptions of Genesis sufficiently to fully explore its emerging theology of creation as eucharist. The fact that it was written as a search for an appropriate environmental ethic rather than a true theological exploration probably contributed to this unfortunate lack of internal consistency. So to may the apparent limitation of engagement with the sciences: while there is a lot of ecological data and imagery, cosmology and evolutionary biology appear to have been ignored.

So, the parts of Healing that focus on the biblical witnesses emphasise a model of H. sapiens as divinely appointed steward over creation, with responsibility to manipulate (cultivate and care for) ‘it’. Other parts emphasise H. sapiens as part of the web of life, to the point that the eucharist becomes a gift for all creation, not just Christians. These approaches simply cannot be harmonised easily, yet they coexist in Healing and in every worship resource which followed it, as we shall see.

---

85 Ibid, p. 27.
86 “God is in, with and under the earth… in the sense of the mystery of the eucharist (p. 26).”
Healing was produced at the same time that the World Alliance of Reformed Churches released their document, Rights of Future Generations and Rights of Nature\textsuperscript{87}. The Commission for Mission, which produced Healing, also brought the WARC statement to the Assembly for adoption. Assembly did so\textsuperscript{88}, but under the title, The Rights of Nature and Rights of Future Generations.

The resolutions begin with a clearly anthropocentric affirmation,

> “We believe that God, the Creator, upholds human dignity. God has created the human in the divine image. No human authority can take away or contest the dignity thus bestowed upon the human”\textsuperscript{89}.

Within that framework, the value of the rest of creation is also affirmed, based on Genesis 9,

> “We believe that God loves the divine creation and wills the development of its life. No creature is indifferent in the eyes of God. Each has its dignity and thereby also its right to existence… we reject the view that animate and inanimate nature are mere objects which stand at the arbitrary disposal of the human.”\textsuperscript{90}

The document then proceeds to outline the rights of future generation of humans, and then the rights of nature. The separation of the two reflects the deep anthropocentrism of the document\textsuperscript{91}. As with earlier Uniting Church resolutions, this anthropocentrism is simply assumed rather than defended. Nevertheless, rights are attributed to “nature”, and “creation” is declared good. Ethical

\textsuperscript{87} See Appendix 4, page 42.

\textsuperscript{88} Resolution 91.14.18.

\textsuperscript{90} Ibid.

\textsuperscript{91} Interestingly, the Assembly resolution refers to the “Rights of Nature and Rights of Future Generations,” whereas the original WARC title, reflected in the chronology of the document, was, “The Rights of Future Generations and the Rights of Nature (see the study guide at http://www.warc.ch/com/pub.html.)
anthropoexclusivism is now emphatically rejected even though its deep anthropocentric roots remain.

The WARC declaration, as adopted by Assembly, is a very brief set of propositions. It is in the accompanying report from the Commission for Mission that we see a little more of their thinking behind proposing the adoption of the declaration.

6.2.7 Commission for Mission report to Assembly 1991

The Commission’s report has a now familiar ring,

“God created human beings in God’s own image… Human beings have a special place in creation. Yet it is a place given so that we might fulfil God’s mission. 92"

They then, however, make a curious statement. They claim that our place in creation is,

“a call to *an office*, to *represent God in the world*, and thus that image is not understandable apart from human beings’ relating to the whole of creation (emphasis mine). 93”

Presumably they were attempting to strengthen the connection between humanity and the rest of creation. What they actually did was introduce the Orthodox church’s “priestly” theology model into Assembly discourse for the first time.

In the Orthodox view, human beings are believed to be, “… a bridge between heaven and earth, a natural bond and mediator between extreme divisions.” 94 Humans are the crown of creation, put on Earth to reign over creation, under God’s direction. The task of humankind is to, “… purify creation, and *elevate it* to the level of its creator.” We are, then, more a minister or priest of creation than a ruler, and it is only through our *priestly* attitude to creation that it will survive.

93 Ibid.

94 All quotes in this paragraph are taken from Tamara Grdzelic, "Creation and Ecology: How Does the Orthodox Church Respond to Ecological Problems?”, *Ecumenical Review* 54, no. 3 (2002): pp. 212-16. All emphases are mine.
Humans alone are uniquely able to change the material world “toward good,” as seen when we turn grape and grain into wine and bread, which is then made good in the eucharist. In summary, humans are, “… the channel through which God’s grace and deliverance is shared with all creation.”

This understanding of humans as the channel of the relationship between God and the rest of creation derives from the Orthodox understanding that the priest is the channel between God and the congregation. The Orthodox, along with the Roman Catholic Church, identify the true church by means of a congregation’s connection to a priest who is himself connected, through apostolic succession, to the apostles and to Christ himself. Christians, then, relate to Christ through their priest. The ecological model expands this to envisage all humans acting as priests for creation. Creation relates to God through the human relationship to God. Humans are placed over other creatures in the same way that the priests were placed over other humans.

This is the abyss of deep anthropocentric ecotheology, and a line of reasoning which those from the Reformed and Protestant wings of the church should reject, since they reject priests as mediators of God in the first place. In the Protestant tradition, it is the congregation itself which is the fundamental connection back to the apostles and to Christ. The minister connects to Christ through her or his participation in the life of a congregation. If that is true, it makes no sense to copy the Orthodox understanding of humans as priests of creation. If anything, that model, appropriately critiqued, would imply that humans are connected to Christ through their participation in the life of creation.

The model was only mentioned in passing in the body of the report, and not in its recommendations. It therefore did not become a theological position of the Assembly, and passed into obscurity.

---

95 Andrew Dutney, "Where Did the Joy Come from (Talk)," (Brisbane: 2001).

96 Though, within its Orthodox framework, it strongly rejects ethical anthropocentrism (Grdzelič, "Creation and Ecology.")

97 Dutney, "Where Did the Joy Come from (Talk)."
The following two examples come from document which only engaged with humanity’s relationship with all of creation obliquely- their main focus was on the relationship between Indigenous and other Australians. It would be unfair, therefore, to place too much weight upon those paragraphs which do mention the rest of creation, yet inadequate to simply ignore them.

6.2.8 SJS 1993- The Land our Mother

The title for Social Justice Sunday 1993 is taken from the testimony of Eva Johnson’s, one of the contributors, and provides the context within which the rest of the document, though it deals overwhelmingly with human issues, should be read. As with the 1977 statement against uranium mining, Earth is assumed to be something to which we (or at least Aboriginal people) relate, rather than an inert resource.

Nevertheless, the Christian affirmation that humans alone are created in the image of God is repeated unchallenged. In the liturgical resource included for use on Social Justice Sunday, the congregation is invited to pray,

"...we are your Children, made in your Image... even the hairs on our head are numbered...tell us anew that the beauty of a garden comes when the flowers are not all the same- you have chosen Variety [referring to variety amongst *H. sapiens* specifically]."\(^98\)

Although the statement that all humans are created in God’s image implicitly distinguishes them from other life forms, this is incidental to the purpose of the document. The aim is not to promote human superiority, but to deny white superiority. As Ann Patel Grey testifies,

“When I was growing up in Sunday school I was taught that Black people were descendents of Ham and therefore a cursed race.”\(^99\)

---

\(^99\) Ibid, p. 4.
Dhalanda Garrawurra emphasises the connection between Aboriginal people and the land, though he does not outright reject the possibility of manipulating the land for human gain,

“We feel hurt, we are related to the land we feel hurt when we see the big machinery change the shape of the land, because we are part of the land... we want to develop, but in the way that will help us... land is precious to us, we are part of the land..."

6.2.9 Statement on Covenanting 1994: Congress’ Response

The following year the non-indigenous part of the Uniting Church entered into a covenant with the Uniting Aboriginal and Islander Christian Congress, alternately described as a sister to, or arm of the Uniting Church. Congress’ response, read by Pastor Bill Hollingsworth, reiterates the preciousness of the land, though it does so in language which fits very well within anthropocentric, western Christianity,

“God… gave humankind his [sic] habitation and placed him [sic] within his [sic] bounds. When He [sic] did this He [sic] gave humankind stewardship over the bounds of his [sic] habitation. For many thousands of years Aboriginal people moved in harmony with creation and subdued it as necessary by hunting, fishing and gathering, thus respecting God's command and allowing the earth to sustain us... In 1788 [our] relation with creation was violently disrupted by the invasion of the European, which robbed us of our stewardship of the land which God gave to us (emphasis mine)."

A recent publication by the Rainbow Spirit Elders also uses western concepts like stewardship and co-creation to name the relationship between Aboriginal people and the land, even though it recognises that Aboriginal theology has been held captive to western ideas, and needs to escape this.

100 Ibid, p. 9.

It is beyond the scope of this thesis to untangle the extent to which contemporary Aboriginal language about the relationship between humans and the rest of creation reflects pre-colonial beliefs, and to what extent it has been adapted through colonisation and missionisation to western concepts. There is also the issue of whether communications to the western church reflect actual beliefs anyway, or simply the compromises required when communicating one’s actual beliefs to a foreign culture. Perhaps the differences between Congress’ response to Assembly and the Aboriginal Delegates’ declaration in the Northern Synod simply reflects different degrees of compromise. As we shall see, even communication amongst white western members of the Uniting Church involves considerable compromise.

The next Social Justice Sunday resource might be one example. Here the church adopted a secular statement on environmental issues as the basis for its own worship.

6.2.10 SJS 1998- International Year of the Ocean

The statement was the United Nations Educational, Scientific and Cultural Organization (UNESCO) declaration of the International Year of the Ocean, and the Ocean Charter it produced in response. UNESCO was at that time thoroughly anthropoexclusive. This mindset, rejected in the 1988 Statement, is adopted unchallenged in the SJS 98 affirmation of faith,

“We believe that the health of the oceans, and the wise, safe and sustainable use of the ocean resources, should be protected for the long term benefit and existence of all peoples. We believe in the God given acquisition of the knowledge necessary for the understanding and stewardship of the oceans…”

The Litanies of Thanksgiving and Intercession assume that the ocean is given to humans for our use, and then call us to stewardship.

---

104 The Ocean Charter is reproduced in full in the SJS 1998 document.

105 National Social Responsibility and Justice, "International Year of the Ocean: Social Justice Sunday 1998," (Sydney South: Uniting Church in Australia, 1998), p. 9. The document actually refers to this passage as a creed. According to Rob Bos (personal communication, October 2003), creeds are usually classic statements of the faith generally supported by the whole church. Statements of faith are generally more specific and have more ephemeral. The above passage fits into the latter category.
“For the incredible varieties and beauty of life that it contains… For oil and other resources that can be drawn from its depths… For the living resources that we draw from the ocean… For physical, chemical and biological products it contains, for the salt and minerals that it can give our bodies… We give thanks to you the Creator”

“Creator God, you call us to be stewards of all creation. Enable us to make wise decisions about the future use of the minerals and other resources on the sea bed, and enable us to carefully manage coastal wetlands and estuaries.”

At times very creation-centred images are used, such as the desire that people would begin, “… embracing one another as the ocean embraces our mother earth.” Unfortunately, no theology to accompany the images is developed, and humans are called to embrace other humans, not the creatures of the ocean. A sermon by Rev. Bill Loader is included, but the only part of the sermon which even mentions the oceans is a cry for westerners to speak compassionately for humans,

“…In this Year of the Ocean, will anyone listen to the cries of Pacific Island people whose islands are threatened by accelerated heating of the earth’s atmosphere and rising seas, if people in richer western lands do not speak up?”

So, Year of the Ocean shows a distinct regression back into ethical anthropoeclusivism, underwritten by the ubiquitous deep theological anthropocentrism. It is not the year of the ocean so much as the year for humans who depend on the ocean. At the level of Assembly policy, however, things remained on track.

6.2.11 Nuclear Energy revisited 2000

In 2000 the Assembly Standing Committee approved a new Nuclear Fuel Cycle Policy106. It explicitly affirms the first two components of anthropocentric theology,

“Made in God’s image, we are commissioned to care for, nurture and sustain God’s good creation. As caretakers of the

earth’s resources, we are called to defend the integrity and diversity of creation (emphasis mine).  

In a resource released to accompany the new policy and educate Uniting Church members, Vicky Balabanski attempts to soften this in her section on theology,

“… the pinnacle of creation was not the creation of human beings, but the Sabbath, with God resting and celebrating the creation (Genesis 2:1-3).”

Yet she admits that human beings are accorded a unique position in creation according to Judaeo-Christian tradition, since we alone are created in the image of God and granted dominion. The assumption of human dominion is repeated in the accompanying worship materials.

So from 1990 to 2000 Uniting Church resources continue the assumption that humans are some sort of pinnacle of creation, since only they have the mandate and ability to exercise control over other creatures, and are the unique bearers of the image of God. Very soon, however, the dissent we sense in Balabanski becomes the sort of open revolt first witnessed in Healing.

6.2.12 World Environment Day 2001- Connect with the World Wide Web of Life

The first World Environment Day (WED) resource was produced by Paul Chalson, a Uniting Church minister with a long involvement in forestry campaigns and ecospirituality retreats. He sought input from Christine Cargill

109 Ibid.

(Director of Assembly Social Responsibility and Justice) and Norman Habel (an ecumenically minded Lutheran). Like the Year of the Ocean document, WED 2001 begins with a statement from the United Nations,

“The theme for 2001, Connect with the World Wide Web of Life, reflects the need to make the connection, in whatever way we can, between ourselves and all life on Earth.”

Not surprisingly by now, this connection is made through the anthropocentric model of stewardship. In the call to worship we hear that,

“We live in God's world, we are not alone. We share this life with the heavens and the earth, with the waters and the land, with trees and grasses, with fish, birds, and animals, with creatures of every form, and with all our brothers and sisters…
Together we form strands in the web of creation woven and held together by God our creator. Together with all creation we join in praising God…we hear the voice of creation.”

So our brothers and sisters are other humans, not the birds, fish and mammals. Although we are acknowledged to be part of the web of creation, at the same time we need to join “all creation”, and hear the voice “of creation”, suggesting that humans are not “creation.”

In an alternative call to worship by Paul Chalson we read,

“In the beginning God made the plants and animals And God made people to live within creation and to be creation's guardian.”

But there is tension between living within something a community, and being its guardian, especially as Chalson also includes a prayer of confession from the USA National Council of Churches, which claims that,

“We forget that we are your creatures and we play at being gods. We neglect the work of stewardship that you have provided for our occupation and our joy (emphasis mine).”

---

111 He initiated the Earth Bible Project, and during 2003-4 helped the Victorian Synod’s Social Responsibility Agency develop a liturgical Season of Creation.

Biocentric theology claims that we have forgotten that we are God’s creatures, and play at being stewards.

The tension in the document is at times simply contradictory. For example, in contrast to the call to worship, which limits family to humanity, an included “psalm of the cosmos” affirms that,

“…into its web [God calls] us forth to walk the land and swim the sea with all our natural brothers and sisters.”

This sense of being part of the family of all creation is emphasised when, like Healing, we read a series of affirmations linking humanity to the web of life in which we live (all emphases are mine),

“[God has] created a fragile world in a perfect and delicate balance. Thinking too much of our own importance we have upset the balance.”

“… everything exists at the courtesy of everything else (attributed to F. Hoyle)

“Loving God… you have woven an intimate tapestry and call it life and called it good…”

So the web of life is perfect, benign, because God built it. Or at least, it was,

“God sits weeping. The beautiful creation tapestry She wove with such joy is mutilated, torn into shreds, reduced to rags, its beauty fragmented by force. (attributed to M. Rienstra)

Here the resource takes for granted the third element of anthropocentric theology, that through human action God’s perfect creation has fallen, though not because of an historical action by the two first humans. Whether life was ever perfect, the extent to which God designed it, and the ways in which human action have changed it, will all be investigated in the light of the science story, starting in chapter 8.

113 Ibid.
115 National Social Responsibility and Justice, "World Environment Day Liturgy 2001."
World Environment Day 2001 closes with a sending out which continues to locate humanity within creation,

“This we know, the earth does not belong to us, we belong to the earth. This we know, all things are connected, like the blood that unites one family. This we know, we did not weave the web of life, we are merely a strand in it. This we know, whatever we do to the web, we do to ourselves. Let us give thanks for the gift of creation. Let us give thanks that all things hold together in Christ (italics indicates audience response).”

So we have mixed messages. Having opened by affirming the anthropocentric stewardship model, WED 2001 closes by claiming that we are, “merely a strand in the web,” pilgrims with not on Earth.

According to Chalson, there are two reasons for the inconsistent messages in WED 2001. Firstly, his own theology shifted, and he struggled to find the words to express this adequately. The steward/guardian model in his contribution represents his old thinking, which was in transition to the “web of life model,” which he fully adopted in 2002. Although he believes that humanity, by the power it has accrued, has a special responsibility within the web of life, the word “steward” conveys concepts he is uncomfortable with.

Secondly, particularly in WED 2001, Chalson was aware that he was producing a resource for all members of the Uniting Church. He believed, based on past experience, that most would be alienated and confused by, “web of life language,” and so opened with the more traditional stewardship model. WED 2001 is, then, an example of the inevitable theological compromises involved in preparing a resource for a diverse community. In contrast, when Chalson was asked simply to contribute a piece for SJS 2002 he felt free to express more closely his personal theology, though because it had multiple contributors, it contains the same mixture of incompatible models.

117 Paul Chalson, Personal Communication, 18 Feb 2003.
118 Ibid.
6.2.13 SJS 2002- Sustaining Creation

For the first time, the 2002 SJS liturgical resource was an ecumenical venture, a joint initiative of the Catholic Social Justice Council, Anglican Social Responsibilities Network, and the Uniting NSR&J. Fortunately for the purpose of this thesis, each denomination produced its own separate worship resources and liturgies, so we can still examine what the Uniting Church, specifically, was saying. The document makes fascinating reading in terms of its theology.

The ecumenical message from the heads of the churches states that it is an ethical imperative which drove the choice of theme, since, “…for many people, concern about the environment has slipped off the agenda.” Once again, the aspect of contemporary thought which is engaged with is environmentalism, not the other sciences.

The ecumenical joint message at the start of the resource contains a number of conflicting ideas about the relationship between *H. sapiens* and the rest of creation,

> “Human beings were not created separate from the natural world- our connection with God connects us also with the environment. We have a responsibility to act as good and faithful stewards of God’s creation.”

In the first sentence humanity is not separate from the natural world. In the second, humanity is contrasted with “God’s creation,” having been appointed stewards, and therefore profoundly separated from it theologically, even if connected ecologically.

This inconsistency continues in the ecumenical introductory sheet, which talks of the God who,

> “… calls us into a very special relationship with the creation- a relationship of mutuality and interdependence. The environment

---

is a gift from God that carries with it responsibility and accountability… 120

What level of mutuality can exist between two entities, when one is a gift to the other? Again, humanity is, in the words of the second sentence, separated from “the environment”, which is a gift. We see a desire to announce the interconnectedness of humanity and the rest of creation confounded by the ongoing assumption that the rest of creation (called simply ‘the creation’ or ‘the environment’ is theologically separate from humanity by nature of being ‘gift’ to the ‘steward.’)

The opening prayer of the ecumenical worship resources sheet states the stewardship model clearly,

“Grant that we may be faithful stewards of the earth, sharing its bounty and preserving its grace. 121”

Then in what reads as a criticism of the above theology, in the Uniting Church section of the kit, is a water liturgy based closely on one by Joel Meadows, a founder of the Earth Team 122,

“You see the problem is that for too long we have seen ourselves as separate from the creation, we are too often caught thinking the “environment” is out there, distinct from ourselves. 123”

Chalson reiterates this in a call to worship which emphasises humanity as part of, “the web of life… sisters and brothers of all that is… one in the web of creation.” The worshippers gather, “… with the birds, the insects and the animals, with the river, the mountains and trees…” Humans are not called to exercise stewardship over their gift, but to, “… be part of the healing of this web which has been stretched and torn. 124”

120 Ibid, "Introduction Sheet”.

121 Ibid, "Ecumenical Resources”.

122 A venture of the Victorian Synod of the Uniting Church, run by volunteers for many years, but with a paid part time worker since 2001.

123 Social Justice Sunday 2002 Team, Sustaining Creation, Action Resource Kit- "Water”.

124 Ibid, Uniting Liturgy.
Yet even within the Uniting Church resources there is not one clear theology. In contrast to Chalson and Meadows, Dorothy McRae-McMahon, a minister with a long track record of engaging in justice issues amongst *H. sapiens*, expresses a strong stewardship theology. In her assurance of forgiveness the congregation is told that God, “… appoints us again to *care for the earth* and all its creatures.” In her intercessions she writes,

“We pray that we will not betray the sacred trust which you have placed in our hands as custodians of this part of your creation- the planet earth… Renew the earth itself, as we give to it, in return for the gifts which we receive from it.”

Interestingly, McRae-McMahon calls on God to help the congregation move beyond a stewardship model to something closer to Chalson’s vision. She prays that God will help us to, “… see your creatures, that they may be one with us,” and repeats the refrain, “Join us into your web of life, O God.” McRae-McMahon is a very experienced liturgist, and it may be that she deliberately moves from stewardship to a call for something beyond as a means of engaging her anticipated audience.

Two pages of the Uniting Church contribution specifically focus on theological reflection, provided by Robert Bos. A further two, by Bos and Cath James contain sermon notes. Robert Bos is the director of the Assembly Theology and Discipleship Agency. Cath James is another founder of the *Earth Team* and works as the environmental project officer for the Victorian Synod’s Justice and International Mission Unit. In the theological reflection Bos borrows heavily from a recent article by the Australian Catholic theologian Denis Edwards, who writes extensively about evolution and theology.

According to Bos, the Spirit is, “… a personal presence within each creature creating communion with all creatures and with the Triune God.” He then quotes Edwards approvingly when he speaks of the Spirit who relates to each creature, “Bringing each into communion with the Trinity… The Spirit always unites

---

125 Ibid.
creatures in Christ, in communion with the one who is the source of all being. In conclusion Bos decides that the Spirit, “… binds me, not only to God’s other creatures, but to God the Holy Trinity.” Here he explicitly locates humanity as a creature amongst other creatures.

The language of communion amongst creatures, and between creatures and God, recalls the profound language of Healing back in 1990. Likewise the claim that this communion is experienced in a benign and loving web,

“In the beginning creation was woven, a beautiful web loved into being, in which all things are connected, in which all things need all things.”

The implications of the intercommunion of all creatures for the practice and meaning of the ritual of communion as currently practiced in Uniting Churches is explored in chapter 9.

In his concluding reflections Bos expresses gratitude to the people who have been good stewards of a favourite beach, and speaks of his own stewardship restoring the acres where he lives. The model of stewardship is taken up as a framework for resisting or restoring perceived negative impact of some humans on parts of the creation. Despite the theological reflection which seems to drive Bos deeper than the anthropocentric notion of stewardship, then, his call to ethical engagement still relies on just that model.

In the sermon notes, Bos and James maintain that Jesus became not just human, but flesh, part of the created order, “Christ did not just become human in order to save humans; he became created matter to save creation.” All creation was, “restored and renewed” by Christ’s death and resurrection, but they do not explore

---

127 Social Justice Sunday 2002 Team, Sustaining Creation, Uniting Liturgy.

128 Bos agreed with this analysis (Robert Bos, 2003.)

129 Social Justice Sunday 2002 Team, Sustaining Creation, Uniting Worship Resources.
exactly what this means. They point out that, “Paul proclaims Christ as Lord, not just of the church, not just of humanity, but of all creation!”

In this affirmation of Christ’s Lordship of all creation, they lay the groundwork for a re-evaluation of the relationship between the Uniting Church, which claims Christ as Lord of its life, and all creation, which is now placed in the same relationship to Christ. They only make the first beginnings of this re-evaluation, calling on Christians to, “… overcome our own arrogance and sense of superiority in relation to other people and creation.  

So, by 2002 the Uniting Church component of the SJS resources are challenging the church, even if inconsistently, to envisage H. sapiens as intimately bound up with the rest of creation; as part of the web of life, as co-communicants and as co-subjects of Christ. Deep anthropocentrism, however, continues to dominate, as seen in the inclusion of the Rights of Nature and Rights of Future Generations declaration. During the preparation of SJS 2002, the NSRJ produced a liturgy for World Environment Day 2002. Although it continued to present an inconsistent message, it contained the seeds of a radical new concept of humanity’s place in the rest of creation.

### 6.2.14 WED 2002- Give Earth a Chance

The opening prayer affirms that the worshippers are a part of creation, inviting them to join with, “the rest of creation.” Normal Habel’s meditation highlights humanity’s connectedness to Earth at one point. He has the soil say, “I am the soil, the adammah from which adam, the first human and all flesh were made.” But when the Word addresses the worshippers, it says, “I invite you to come and serve…and to join me in healing Earth.” To which the worshippers respond, “We will serve Earth with you.”

---

130 Ibid.

So, the soil calls humans to affirm their intimate connection, and the Word drives a wedge between them. Earth has become an other. One cannot serve oneself but only an other, and by choosing service one is assuming power over that which is served, which is then given up. Not only must the one who would be first be servant of all, but the one who chooses servanthood presumes that they are first of all. This implies either a total separation (if only humans are credited with the image of God), or a hierarchical separation (where all of life is the image of God, but humans especially so). I will explore the different ways of envisioning the image of God in chapter 9.

A further reflection, sourced from the Web of Creation site, has the worshippers say to the seeds on which they reflect,

“In caring for you we shall experience the most ancient profession of the human family, the primal vocation of being workers in the garden.”

Not only does this perpetuate the stewardship model, it explicitly assumes that agriculture is a divine fiat.

The children’s address contains a short reflection on the relationship between Aboriginal Australians and the soil. The main claim is that, because the Aboriginal people got what they needed directly from the soil, they knew it was precious and related to it as ‘mother’, because, “just like they were reliant on their mothers to feed them, they relied on the soil to feed them and house them and keep them warm...” So the land is mother like because it provides resources, not because of relational ties.

The children’s address then talks about the existence of soil microbes,

---

132 Mark 9:35, 10:44.
134 Ibid, pp. 6-7.
135 This is the implication drawn from the passage, not from Aboriginal spirituality or theology directly.
“For in just this bowl of soil there are millions of tiny, tiny living organisms. We are just beginning to understand the role that these organisms play in life - we’re just beginning to learn that it is these small little microbes in this soil that sustains most of life here on earth. Jesus says to us, Whatever you do to one of the least of these who are members of my family, you also do it to me.’ Matthew 25:40 (NRSV)”

A link is thus made between the soil microbes and the, “least of these,” the family of Jesus! Here we have a profound statement of the relatedness between Christ, humanity and microbial life, without any clear justification in the preceding text. It is bizarre that the most deeply biocentric theology in all of the documents so far reviewed appears without justification or explanation, or investigation of the consequences, and that of all places it appears in a children’s address.

The sermon returns the reader to more traditional territory. Wally Fejo revisits the Genesis flood story. There is nothing to suggest that he disputes the story’s historicity, indeed he seems to assume it. He definitely accepts the theology unquestioningly. God destroys Earth because, “it is sick – corrupted by human evils – and in need of healing.”

Fejo continues with an anthropocentric example of Aboriginal people’s relationship to the land,

“The flood is like the fires which we Indigenous Australians once used to light in order to burn off part of the land. The surface is burned and the debris is removed to stimulate new life in the land. The spider, for example, stays alive and spins her web again. Life returns because life is in the land.”

Fejo does not explore the documented impact of Aboriginal people on the composition of Australian ecosystems, especially through the use of fire.

---

137 Ibid.
“Life” was not stimulated, but life forms and ecosystems which suited Aboriginal people were selected for, and only those tree species able to cope with the greatly increased burning regimes survived. So, Fejo has to an extent used the methodology of section eleven in the Basis, in interacting with contemporary Indigenous thought. He has, however, shared with the biblical witnesses the tendency to make the human story central in the story of life.

Despite his assumption that what was good for Aboriginal people was good for all life, Fejo makes a useful contribution to those who remain within a very traditional framework in his reflection on the flood myth,

“Traditional interpretations of this chapter in Genesis have tended to focus on the content of God’s promise never to destroy the Earth with a flood again. Just as significant is the fact that God is making a covenant with creatures other than humans. God’s covenant with all living things means that God relates to the animals, birds and other creatures on Earth as living subjects, not simply as mindless objects.”

This conservative rendering of the Genesis account is followed by a remarkable challenge in a call to prayer sourced from the Web of Creation,

“We who have lost our sense and our senses - our touch, our smell, our vision of who we are. We who frantically force and press all things, without rest for body or spirit, hurting our earth and injuring ourselves: we call a halt. We need to rest and allow the earth to rest. We need to reflect and to rediscover the mystery that lives in us, that is the ground of every unique expression of life, the source of the fascination that calls all things to communion (emphasis mine).”

Like the call at the end of the SJS 2002 to, “... overcome our own arrogance and sense of superiority in relation to other people and creation,” this challenge can be directed as much to the various contributors to WED 2002 as to the people who use it. The contributors do not appear to agree, “who we are.”

I have already mentioned the shift in theology of some contributors, and the difficulty they experienced in finding the right language to express their new worldview. There was also the issue of communicating with a broader audience. Finally, I believe, there is an acute sense of urgency. In constantly responding to environmental crises in these worship resources there is a sense of the frantic, of convincing people to act rather than to reflect deeply on their anthropocentric prejudices. The Web of Creation resource acknowledges this need for rest and reflection, the need to take the time to look at our core beliefs, not only our actions. When I prepared the World Environment Day resource for 2003 I had this at the forefront of my mind.

6.2.15 WED 2003- Water, two billion people are dying for it

With the approval of Rev. Elenie Poulos, director of Uniting Justice\textsuperscript{141}, I used WED 2003 to highlight the two theological trends which I have mentioned above. An introduction highlighted the issue for the reader,

“Are we divinely appointed stewards of creation? Are we alone the bearers of the image of God, fundamentally unique amongst all creatures? Or are we an integral part of the web of life, one species amongst many, different only in degree from the other animals?

Is the primary story that between God and humanity, or God and life? Did pain and death enter creation through human action, as told in Genesis 1-3, or are they essential ingredients of life - God’s good gifts to us? Are we the pinnacle of creation, or just a part of the ebb and flow of evolution?\textsuperscript{142}"

\textsuperscript{141} In May 2003 the Assembly Social Responsibility and Justice Agency was renamed UnitingJustice.

Throughout the resource, each element of the liturgy included an anthropocentric and a biocentric contribution, some of which were original and others taken from past Assembly resources. So for the first time the choice between anthropocentrism and biocentrism was made plain to the membership of the church in an Assembly resource.

What the resource did not do, was make judgment between the two theological streams. Rather, as the introduction explained,

“Both streams are presented as valid, coherent systems. Judging between the correctness of the two needs to take place on a number of fronts. The thesis I am currently undertaking is an attempt to make academic judgments. The Basis of Union reminds us that as we gather in worship our faith is awakened, our attention commanded, and we hear Christ the Word of God as we appropriate the Scripture. It is, then, to some extent, in the practice of worship itself that we discern the truth or otherwise of the affirmations made in worship, reassured that we have the gift of the Spirit that we may not lose the way, and challenged to continue in the pilgrimage of faith to which the whole church is called.”

How will the academic judgments I allude to be made? Both stories are making claims about the place of humans on Earth, and their relationships to other creatures. Some fields of scientific endeavour also make claims about these things. But is that relevant? Is it legitimate to assess theological claims in the light of scientific data? This depends on how we believe science and theology relate to each other.

---

143 Ibid.
7 Methodology: How to judge between the two paradigms

7.1 The relationship between theology and science

The relationship between theology and the sciences can be divided roughly into three kinds, all of which persist today. The first is the attempt by the churches to censor scientific data, or at least the theories built upon this data, to control what scientists may say. In recent years, with the wane of religious influence and the rise of the status of science, the attempt at control has been seen in the other direction, with scientists making judgments about what religions may say.

Partly in reaction against this, a second approach, the argument that science and religion addressed different questions, and should not interfere with each other became popular. In reaction against both of these approaches, various attempts at dialogue between science and theology have been proposed. These three broad approaches; conflict, separation, and dialogue, are explored below.

7.1.1 Conflict and the attempt to control each other

Galileo’s conflict with Pope Urban VIII is a commonly referred to example of conflict between the church and science. Galileo’s observations of the movement of the stars and planets in 1610 led the Roman church under Pope Paul V to prohibit the teaching that the planets revolve around the sun, not Earth, in 1616. Pope Urban VIII was inaugurated in 1623, and Galileo escalated tensions when he published the *Dialogue on the Great World Systems* in 1632, which ridiculed the Pope. This led to Galileo being handed over to the Inquisition, upon which he recanted his proposition that Earth was not the centre of the universe. Mark Worthing, in a brief summary of the history of the relationship between science and theology, points out that there were personal and political factors involved in

---

145 Ibid.
the Galileo affair\textsuperscript{146}. It was not simply a matter of science versus theology. As Edwards and Ted Peters briefly demonstrate, cosmologies which did not centre on Earth were entertained long before Galileo, including the possibility of many worlds and speculations about the role of Christ in life elsewhere\textsuperscript{147}

It was the responses to Charles Darwin’s \textit{Origin of Species} which lead to the greatest rift between science and theology, even though many theologians were comfortable with Darwin’s theory\textsuperscript{148}. There was not so much a rift between science and theology initially, but a rift within theology. Worthing argues that the anti-Darwinians were the most vocal group. Further, the task of pro-Darwinian Christians was made more difficult once writers like Thomas Huxley began to argue that Darwin’s theories implied a necessary agnosticism. It was, then, the philosophical and religious responses to Darwin’s theories which created the increasing polarity between science and theology.\textsuperscript{149} Subsequent scientific discoveries, ranging from the realization of how massive and old our universe is, to the explosion of knowledge about intracellular and sub microscopic systems, placed the church within a society with a completely different worldview from that of the biblical witnesses.

The church has responded in various ways to this new information. Early attempts by the church to control and censor scientific inquiry diminished as the church has lost political power throughout the western world. A new attempt at control then came from some scientists, who sought to nullify religion completely, or to take over from theologians in declaring what can be said about God. These approaches are labelled scientism and scientific imperialism respectively by Ted

\textsuperscript{149} Ibid: pp. 8-9.
Peters in his comprehensive review of the interaction between theology and science\textsuperscript{150}.

Peters believes that \textit{Ecclesial Authoritarianism}, found predominantly in the Roman Catholic church, has waned since the mid 19\textsuperscript{th} century, especially through Vatican II, and the recent work by Pope John Paul II to foster dialogue between theology and natural science. He cites John Paul’s study of the Galileo affair, and declaration that the church erred in condemning him\textsuperscript{151}. He implies that the Roman Catholic model, or the Pope’s at least, is that of separating the two disciplines to avoid conflict. However, although the Pope does use language which implies separation in places, when it comes to the most theologically interesting questions he still clearly claims control for the church.

For example, although Pope John II described the pontifical Academy of Sciences as a place where,

\begin{quotation}
\textit{…a chosen group of scholars … could, working with complete freedom, inform the Holy See about the developments in scientific research and thus provide aid for reflections \textsuperscript{(emphasis mine)}.}\textsuperscript{152}
\end{quotation}

He immediately seeks to limit their freedom, moving from separation to control,

\begin{quotation}
\textit{…\textit{I would remind you that the magisterium of the Church has already made some pronouncements on these matters, within her own proper sphere of competence. I will cite two such interventions here… there is no conflict between evolution and the doctrine of the faith regarding man [sic] and his vocation, provided that we do not lose sight of certain \textit{fixed points} (emphasis mine).}}\textsuperscript{153}
\end{quotation}

Section 4 highlights that evolution is only a theory, or theories, which must be judged alongside the Revelation of God, which is by implication not theory but unquestionable fact. Section 5 opens,

\textsuperscript{150} Ted Peters, "Theology and Science: Where Are We?,” \textit{Uniting Church Studies} 6, no. 1 (2000): pp. 39-40.

\textsuperscript{151} Ibid: p. 43.

\textsuperscript{152} Pope John Paul II, \textit{On Evolution}.

\textsuperscript{153} Ibid.
“The magisterium of the Church takes a direct interest in the question of evolution, because it touches on the conception of man [sic], whom Revelation tells us is created in the image and likeness of God… ‘man [sic] is the only creature on earth that God wanted for its own sake’.”

The unquestionably anthropocentric nature of Roman Catholicism is then entrenched in section five and six,

“Pius XII underlined the essential point… the spiritual soul is created directly by God… As a result, the theories of evolution which… regard the spirit either as emerging from the forces of living matter, or as a simple epiphenomenon of that matter, are incompatible with the truth about man [sic.]. They are therefore unable to serve as the basis for the dignity of the human person… With man [sic], we find ourselves facing a different ontological order—an ontological leap, we could say.154”

It should be apparent from this that Catholic theologians have significant limits placed on their investigation of human nature and the relationship of H. sapiens to the rest of creation.

7.1.2 Separation of science and theology

Whatever the Catholic hierarchy may say, Peters believes that attempts by actual theologians and scientists to control the work of the other finds limited support in each discipline. He claims that, in an effort to avoid conflict, a truce has been negotiated by separating the two spheres of enquiry, and that this “two language theory” is the dominant approach in academic circles.155 It is a solution which he rejects, since it assumes that shared understanding between the disciplines is impossible, and therefore, “… gains peace through separation, by establishing a demilitarized zone that prevents communication.156

154 Ibid.
155 Peters, “Theology and Science: Where Are We?,” p. 40.
According to John Haught, up until the late eighties at least, theology was more comfortable engaging with psychology, history and sociology than cosmology\(^{157}\). This was my experience of theological training in the nineties. The legacy of the separation of science and theology is that, as David Gosling complained, churches,

“…lack a credible theology and philosophy of nature which takes into account the discoveries and insights of both science and theology.”\(^{158}\).

How pervasive is this approach today? Worthing claims that support for the ongoing separation of science and theology is rapidly diminishing\(^{159}\), though Santmire suggests that it still has considerable influence. He believes that,

“…we have only just begun. Much, although surely not all, of the new growth of interest in theology and nature appears to be superficially rooted.”\(^{160}\).

Stephen J. Gould claims that this approach is a consensus amongst “thoughtful scientists,”\(^{161}\) but then goes on to admit that the two “Magesteria”, or teachings, bump right up against each other in complex ways. The “deepest questions” of life, he believes, require one to pay attention to both\(^{162}\). He goes on to celebrate the fact that the “independence” of the two fields encourages respectful discourse on the way to the common goal of increased wisdom\(^{163}\). What he is actually promoting, then, is not a true separation, but sufficient independence to allow at least some kind of dialogue. Peters, Haught, Gosling, Worthing and Santmire all

\(^{159}\) Worthing, "Science and Theology," p. 11.

\(^{162}\) Ibid: p. 20.

\(^{163}\) Ibid: p. 62.
participate in this dialogue, with varying levels of optimism about the depth to which it can proceed.

7.1.3 Theology in dialogue- seeking consonance with, and integration of, science.

The call for Christians to be informed by scientific knowledge has a long history. Augustine issued such a call almost two millennia ago, in an often cited passage which is worth repeating at some length,

“Usually, even a non-Christian knows something about the earth, the heavens, and the other elements of this world, about the motion and orbit of the stars and even their size and relative positions, about the predictable eclipses of the sun and moon, the cycles of the years and the seasons, about the kinds of animals, shrubs, stones, and so forth, and this knowledge he holds to as being certain from reason and experience. Now, it is a disgraceful and dangerous thing for an infidel to hear a Christian, presumably giving the meaning of Holy Scripture, talking nonsense on these topics; and we should take all means to prevent such an embarrassing situation… If they find a Christian mistaken in a field which they themselves know well and hear him maintaining his foolish opinions about our books, how are they going to believe those books in matters concerning the resurrection of the dead, the hope of eternal life, and the kingdom of heaven…? … to defend their utterly foolish and obviously untrue statements, they will try to call upon Holy Scripture for proof and even recite from memory many passages which they think support their position, although they understand neither what they say nor the things about which they make assertion. [1 Timothy 1.7]”

Augustine, however, was primarily concerned with ensuring that the Christian’s ability to convert others was not confounded by ignorance of science. Peters and the others go much further than this, trusting that the dialogue with science will somehow inform the Christian story itself.

---

Admittedly, Augustine’s concern is to ensure that apologetics is not undermined by ignorance, not to change theology or its central claims in the light of insight from the sciences.
Holmes Rolston III describes his hopes for dialogue thus,

“Science, by redescribing nature, places constraints upon what concepts of God are credible, even though science by this redescription prescribes nothing about God’s existence. It sets limits within which meaning accounts can work.\textsuperscript{165}\textsuperscript{165}

Yet this is surely a minimalist hope for a good dialogue, in which one party merely sets limits about what another may say, rather than sparking off new insights. Peters’ approach to dialogue, which he calls \textit{hypothetical consonance}, requires that theologians be open to learning something new,

“Rather than beginning from a rigid position of inviolable truth, the term ‘hypothetical’ asks theologians to subject their own assertions to further investigation and possible confirmation or disconfirmation. An openness to learning something new on the part of theologians and scientists alike is essential for hypothetical consonance to move us forward.\textsuperscript{166}\textsuperscript{166}

Peters cites Denis Edwards, an Adelaide based Catholic theologian, as an example of this approach. He quotes Edwards,

“… there is every reason for a Christian of today to embrace \textit{both} the theological teachings of Genesis \textit{and} the theory of evolution… [this] does demand a rethinking of our theology of the Trinitarian God at work in creation.\textsuperscript{167}\textsuperscript{167}

Again, I believe Peters is being too optimistic about the possibilities within Catholicism. As a Catholic theologian Edwards is limited in the extent to which his investigation of the theory of evolution can take him. He is not permitted to conclude that \textit{H. sapiens} is ontologically indistinguishable from other species, and distinguished only by degree\textsuperscript{168}\textsuperscript{168}. His claim that we can take the theological

\textsuperscript{166} Peters, “Theology and Science: Where Are We?,” p. 47.
\textsuperscript{168} The situation is a little less clear with the other hypothesis excluded by the Pope, that of polygenism. Edwards refers to Rahner’s article on monogenism (Karl Rahner (ed.), \textit{Encyclopedia of Theology: A Concise Sacramentum Mundi} (London: Burns and Oates, 1975), pp. 974-77.) There Rahner argues that polygenism is permissible provided it does not undermine what monogenism was though to protect. Edwards believes that the lack of any discussion or dispute of Rahner’s paper means that its basically accepted in Catholicism.
insights of Genesis seriously even after rejecting its cosmology is not well
defended. Perhaps, since he is bound by the papacy to accept these theological
insights there seemed little need.

It is not my desire to criticise Edwards’ project *per se*, it is a major contribution to
Catholic thought, and I explore some of its potential in the theology section of this
thesis. It is the approach of Catholicism in the first place which is problematic,
leaving Edwards, in my estimation, amongst those of whom Peters says,

“… where leading scholars find themselves, to my
interpretation, is with one foot in the two-language theory and
the other stretched for a stride to go beyond.”

Peters briefly surveys a number of theologians who either strive for, or are
sympathetic to consonance. He sees a tension between those who wrestle deeply
with the actual scientific ideas, like Ian Barbour and Arthur Peacocke, and those
with a confidence in the basic claims of the Christian faith, like John
Polkinghorne. He believes that the former reject or underemphasise Christian
hope in the resurrection, whilst the latter to fail to really develop their theology in
response to scientific insight. Robert Russell is presented as holding a
compromise position, since he is clear that science and theology will at times be
dissonant. For example, he accepts the eventual heat death of the universe, but
accepts, as Polkinghorne claims, that this fact is not compatible with Christian
eschatology.

Barbour is more optimistic than Peters about the possibility for dialogue between
science and theology. Indeed, he criticises the very notion of dialogue itself,
because it assumes too sharp a distinction between the parties involved, and has
too modest an expectation. Rather than consonance, he is committed to

---

169 Peters, "Theology and Science: Where Are We?,” p. 51.
integration, where theologians and scientists do not simply dialogue, but attempt to integrate their fields into a single coherent system.\textsuperscript{173}

Barbour, Peters, Peacocke and Polkinghorne are all engaging in some form of a theology of nature, where they start from a religious tradition and attempt to revise any theological claims that are inconsistent with scientific discoveries. Sounding very like Peacocke\textsuperscript{174}, Polkinghorne\textsuperscript{175} and even Peters\textsuperscript{176}, Barbour argues that, “Theological doctrines must be consistent with the scientific evidence… even if they are not derivable from them.”\textsuperscript{177}

So although they disagree on the details, their nomenclature, and the degree of optimism about the outcomes\textsuperscript{178}, they seem to agree that integrative theology is desirable, and consonance achievable to a substantial degree, even if theology may wish to speak about things for which there is not yet any scientific data. An integrative framework will not be able to be proven true, only consistent, and hopefully more consonant than its rivals.

Within the Uniting Church Colin Weightman adds to this discussion, by undermining the sharp discontinuity which is commonly assumed to exist between theologians and scientists in the first place. Weightman argues that the rise of science is, “complex and multi-directional and bound up with both Christian and magical theology,” so that,

“… it has never been easy, and it remains difficult to say what science is. This further complicates any attempt to distinguish it

\textsuperscript{175} Peters, "Theology and Science: Where Are We?," p. 60.

\textsuperscript{176} “… theological reflection on creation must be consonant with what science says about Big Bang and Evolution” (Ibid: p. 61.)

\textsuperscript{178} Polkinghorne, for example, agrees with Peters that Barbour is much too optimistic (Polkinghorne, *Scientists as Theologians*, pp. 81-86.)
from other intellectual endeavours, Christian theology included.\textsuperscript{179}

He argues that the separation of the realms of science and theology, “… denies the historical evidence that each \textit{has} in fact influenced the other (emphasis his).\textsuperscript{180}

As a result there has always been a, “… \textit{dynamic} character of the interaction of theology and science over time (emphasis his).\textsuperscript{181}

So for Weightman, rather than scientists and theologians attempting to dialogue from within predominantly independent intellectual disciplines, “both science and theology may regulate the choice of the other.\textsuperscript{182}” This regulation, however, is limited by Weightman’s claim that Christian theology orbits around scripture and tradition, whereas scientific theories orbit around the material world. So then, they are neither adrift, nor in the same orbit, but interact with each other in various ways, both also being influenced by other philosophical and social movements. Dialogue between the two, then, “… needs to accord both science and theology some degree of autonomy yet at the same time seeing the stamp of each upon the other.\textsuperscript{183}” Weightman does not have a label for his understanding of the inter relationship between science and theology, but in this thesis I shall assume that his contribution simply adds a nuance to the integrative, consonance seeking approach to dialogue already described.

Peters, Barbour and Weightman are talking about essentially the same process, though at times from different perspectives. They all recognise that theology, to be legitimate, must be consistent with insights from the sciences without being obliged to derive all of its propositions from the sciences. The existence of God is not provable scientifically, and need not be. At the same time, any claims about God and how God interacts with the physical world ought to be consistent with

\textsuperscript{180} Ibid: p. 29.

\textsuperscript{181} Ibid: p. 30.

\textsuperscript{182} Ibid: p. 31.

\textsuperscript{183} Ibid: p. 32.
what science has discovered about how the world works, allowing for the fact that scientists themselves disagree about exactly what has been discovered. The most convenient label for this process is still, I believe, dialogue, if the above critiques and modifiers are taken into account.

7.2 The Uniting Church is a dialogue church

Control, separation, or “dialogue.” Which of the three approaches is the most appropriate within the Uniting Church? Section eleven of the *Basis* makes it very clear that the Uniting Church is committed to the latter,

“...the Uniting Church enters into the inheritance of literary, historical and scientific enquiry which has characterised recent centuries, and gives thanks for the knowledge of God's ways with humanity which are open to an informed faith. The Uniting Church lives within a world-wide fellowship of Churches in which it will learn to sharpen its understanding of the will and purpose of God by contact with contemporary thought. Within that fellowship the Uniting Church also stands in relation to contemporary societies in ways which will help it to understand its own nature and mission.184”

This dialogue with other churches and contemporary society is driven by a belief in the need for constant reform, that is, the need to be consonant with reality. This principle is implied in the *Basis*’s use of the metaphor of the church as a *Pilgrim People*, and is made explicit in many places,

“[The uniting denominations] remain open to constant reform under his Word...The Uniting Church will keep its law under constant review so that its life may increasingly be directed to the service of God and ... The Uniting Church prays that, through the gift of the Spirit, God will constantly correct that which is erroneous in its life.185”

Although I have shown that resolutions and resources released by the Assembly and Synods lack any signs of serious dialogue with the natural sciences beyond ecology, some individuals in the church have published papers in which they take up the challenge.

184 Uniting Church in Australia, *Basis of Union*, section 11.

185 Ibid, sections 1... 17... 18 respectively. This emphasis comes in response to comments on the original 1964 draft of the *Basis* (Young, *Introducing the Basis of Union*, p. 11.)
7.3 Uniting Church dialogue with the sciences

Dutney is one Uniting Church theologian who called the church to dialogue with science. In 1987 he recognised that,

“If the church is to mobilize it must be rehabilitated, theologically and ecclesiologically. But if the rehabilitation of Australian Christianity is to get anywhere, theologians must break out of the cloister and begin to work closely with the scientists and philosophers who can help them develop a coherent and credible ecological theology (emphasis mine)." 186

He took this call seriously himself. He wrote this challenge around the time he drafted the 1988 Statement to the Nation. From then until 2002 he was often involved in the formation of Uniting Church policy on uranium mining and nuclear weapons. His primary focus from the mid-nineties, however, was the dialogue between theology and the biomedical sciences, with a strong focus on ethics. So, he has, “broken out of the cloisters,” in very significant ways, but not in the direction of cosmology and evolution.

The year after Dutney wrote his challenge, Rod Rogers, a Uniting Church member and professor of botany at the University of Queensland, wrote a paper in the Uniting Church journal, *Trinity Occasional Papers*. He attempted to rethink theology in the light of basic insights about evolution. His commitment to integrative dialogue is seen in his question,

"Can we restate the essential content of Christianity using the thought forms of natural science? Can we exploit the thought forms that are those of our own society, not a society that peaked over 2000 years ago?" 187

Birch also sought to make theology consonant with the life sciences around this time. He co-authored, *The Liberation of Life* in 1981 188 which tackled the issue,

---

continuing with his own book in 1988\textsuperscript{189}. This preceded the much more popular and widely read, \textit{On Purpose}\textsuperscript{190} in 1990, the same year that \textit{Liberation of Life} was reprinted. He engaged the Uniting Church directly in his speech to the Queensland Synod\textsuperscript{191} and continues to produce books and articles on this dialogue, using process philosophy as his basic framework. Birch’s significance lies in his attempt to integrate a range of natural sciences, not just ecology, into his theological model. This attempt at integration across a number of fields in the life sciences has not been the general trend within the Uniting Church. As Clive Pearson says,

“The tendency has often been to look upon ecological matters as an ethical appendix to theology, a form of applied theology, or for the odd individual doctrine, here or there, to be duly greenwashed\textsuperscript{192}… The tendency of many responses in the church to the ecological crisis is to provide environmental facts and figures, a biblical text or two for reflection, and maybe some practical hints on recycling. They have a place, but they do not help the Australian church become sufficiently aware of "what's happening" world-wide in the field of theological reflection on these matters. The common desire is to be "doing" rather than to recognise \textit{the need to develop a theoretical basis and observe the subsequent downstream effects in the ministry & mission of the church} (emphasis mine).\textsuperscript{193}.”

Here the Uniting Church simply reflects the wider Christian movement. As late as 1996 John Polkinghorne concluded a book which surveyed the theological methods of several “scientist-theologians” with the appeal,

“I would like to see more theologians, not just taking an occasional interest in these matters, but joining in a more sustained way in the interdisciplinary encounter. There is much work still to be done, and we need their help.\textsuperscript{194}.”

\textsuperscript{191} Charles Birch, ”A New Dialogue between Science and Religion,” \textit{Trinity Occasional Papers} 11 (1992). This is a reproduction of his Rollie Busch lecture at the Queensland Synod gathering on 26 August 1992 in St Lucia.

\textsuperscript{192} Pearson, ”Towards an Australian Ecotheology,” p. 14.

\textsuperscript{193} Ibid: p. 27.

\textsuperscript{194} Polkinghorne, \textit{Scientists as Theologians}, p. 86.
Two years later Andrew Linzey claimed, “That we are still at the beginning of asking theological questions that matter about animals is painfully obvious.” And, he added, it was still far from clear whether mainstream theology was capable of escaping its humanocentrism.

In 2000 Paul Santmire, having admitted that the church’s ecological record was deeply ambiguous, expressed optimism for the future, but admitted that the task had only just begun, and that much of the apparent interest was only, “shallowly rooted.” In the same year Stephen Dick, a historian of science, lamented the ongoing absence of a, “Thomas Aquinas for cosmotheology.”

Finally, in 2003 Katherine Duffy complained that,

".. mainstream theology is not much closer to discovering a God for evolution than it was in Teilhard's day. Today, it is still quite rare to find a serious scholar of either science or theology willing to spend a lifetime on this task."

Whether mainstream theology can escape its humanocentrism is still far from clear. There is still no modern Aquinas. I hope, however, to move us closer to discovering this God for evolution, and at least entertain the possibility of it being a life time’s work. I hope to, “break out of the cloisters,” to better integrate a range of life sciences with theology within the Uniting Church tradition. In

---

196 Ibid, p. xvi.

acknowledgment of Weightman\textsuperscript{201}, it must be said that I am already heavily influenced by life outside the cloister. Although I am an ordained minister in the Uniting Church, I obtained an honours degree in zoology before even becoming a Christian, and undertook postgraduate environmental studies as part of my ministry training. Although both my science and theology are barely post-graduate\textsuperscript{202}, I hope that this combination is a useful one in continuing the, “theological rehabilitation,” of the Uniting Church, and the development of a theoretical basis for the ministry and mission of the church.

I do not begin to hope that my conclusions will gain universal assent. As Polkinghorne says, the scientific- and especially theological- landscapes are far too heterogeneous for that. As a result,

“… those who engage in inter-disciplinary work cannot avoid taking intellectual risks as they venture beyond the safe perimeter of their primary discipline… We must seek to listen to the experts, but we cannot simply capitulate to them—particularly when they do not speak with one voice.”\textsuperscript{203}

I \textit{do} hope to show that the process of consonance has not been taken nearly far enough in the engagement of theology and evolutionary biology in particular, and to reach conclusions which are consonant with the scientific data as I understand them. I also want those conclusions to remain, if possible, consonant with Christian theology, and specifically with the Uniting Church’s vision of Christianity. I will now, therefore, look at how the Uniting Church locates itself within the whole church, its vision of the church as a pilgrim people, and the “landmarks” by which it expects this pilgrim people to orient themselves in their ongoing journey.

\textsuperscript{202} As an adult convert, a similar thing could be said about my experience of the life of faith and worship of the church.

\textsuperscript{203} Polkinghorne, \textit{Scientists as Theologians}, p. 86.
7.4 The Uniting Church within the church

The Uniting Church in Australia formed in 1977 when the Methodist, Congregationalist and Presbyterian denominations united. When discussions for this union began, it was not seen as the formation of a new denomination, but a step on the path towards the creation of one Australian Church. This itself was seen as a step on the way to the end of all denominations globally\(^{204}\). As the Basis, puts it, the Uniting Church claims that it, “…lives and works within the faith and unity of the One Holy Catholic and Apostolic Church\(^{205}\),

This Basis continues to have authority in the Uniting Church. At ordination, all Uniting Church ministers were until recently required to affirm that they, “…adhere to the Basis of Union of the Uniting Church in Australia…” The Basis itself spelt out the meaning of this undertaking,

> “…the phrase "adhere to the Basis of Union" is understood as willingness to live and work within the faith and unity of the One Holy Catholic and Apostolic Church as that way is described in this Basis (section 14).”

In 1997, after extensive debate and several drafts, this requirement was modified so that ministers are now asked,

> “In your life and work within the Uniting Church will you be guided by its Basis of Union..?\(^{206}\),

Whatever this change means in practice, it has not in any way weakened the Uniting Church’s commitment to the ecumenical vision of the Basis, as ministers are now required to specifically affirm that they will,

> “…embrace the faith and unity of the holy catholic and apostolic Church as described in the Basis of Union…\(^ {207}\),

\(^{204}\) Uniting Church in Australia, *Basis of Union*, section 2.

\(^{205}\) Ibid.

\(^{207}\) Ibid.
This commitment was emphasised within the life of the Uniting Church from the outset. Davis McCaughey, a major influence in the drafting of the *Basis*, and first president of the Assembly, emphasised the Uniting Church’s location firmly within the One Church,

“The Uniting Church should be particularly careful not to develop a terminology which suggests distinctive doctrines. We have no identity to separate us from the Church of God.”

This reiterates the sentiments he expressed during his retiring address at the Second National Assembly of the Uniting Church in 1979,

“At all events the cry for a sense of identity in the Uniting Church cannot be answered by the offer of a new kind of church patriotism. In an important sense, *we in the Uniting Church in Australia have no identity, no distinctive marks* other than belonging with the people of God brought into being by the death and resurrection of Jesus Christ on their way to the consummation of all things in Him (emphasis mine).”

The key reason for the rejection of any *distinctive marks* by the framers of the *Basis* was that such marks would stand in the way of ecumenism, and future unions with other denominations. The Uniting Church was not established to be a new denomination, but as the first step towards ending denominations, in Australia at least. It is for this reason this it is the Uniting, not United Church in Australia. In the Uniting Church,

“Ecumenical commitment is not just an attractive option for an enthusiastic few...It is an essential part of being and belonging to the Uniting Church...And not just because the Basis says so, but because we are not ‘church’ without it.”

---

208 Dutney, *Manifesto for Renewal*, pp. 89-93. Smith believes that McCaughey was the most important figure in the drafting of the *Basis* (Rodney Smith, "The Assembly," in *The Uniting Church in Australia: The First 25 Years*, ed. Susan Emilsen and William Emilsen (Melbourne: Circa, 2003), p. 10.)

211 “We chose the word ‘uniting’ rather than ‘united’ for the name of this church, to signify that unity is a goal to be sought rather than a final state already reached” (R A Busch, "President’s Address to the 1982 Assembly," (1982).)

The *Basis* committed the Uniting Church to remain open to constant reform\(^\text{213}\), including reform of its laws\(^\text{214}\), partly to enable future union with other denominations. Any future unions would not be achieved by simply weaving the different traditions together. Rather, the approach can be inferred from the way in which the Uniting Church itself was formed,

“…[we] wished our ears to be open to what God has said, is saying and would say to and about his church, before we listened too closely to the understandings and misunderstandings of their own traditions by Australian churches, and attempted the rather fruitless task of seeing how such statements could be made consistent with one another" (emphasis mine).\(^\text{215}\).

As far as the *Basis* is concerned, the Uniting Church is but a stepping stone to a new United church, its shape controlled by God’s desires for the present and future, not by the church’s fallible responses of the past. The final unity of the church is itself merely a subset of the, “…the final reconciliation of humanity under God's sovereign grace (emphasis mine).\(^\text{216}\).” Even the reconciliation of humanity is but a smaller part of God’s plan for the reconciliation of all creation, as expressed in section three of the *Basis*,

“…God in Christ has given to all people in the Church the Holy Spirit as a pledge and foretaste of that coming reconciliation and renewal which is the end in view for the whole creation. The Church’s call is to serve that end: to be a fellowship of reconciliation, a body within which the diverse gifts of its members are used for the building up of the whole, an

\(^{213}\) Uniting Church in Australia, *Basis of Union*, section 1.

\(^{214}\) “…since law is received by human beings and framed by them, it is always subject to revision in order that it may better serve the Gospel. The Uniting Church will keep its law under constant review…” (Ibid, section 17.)

\(^{215}\) Davis (J. D.) McCaughey, "Church Union in Australia," *The Ecumenical Review* 17 (1965): p. 41. Cited, not seen, in Dutney, *Manifesto for Renewal*, p. 15. When union discussions were at a very early stage, the comparative method McCaughey rejects was exactly that proposed by the Presbyterians, who stated that they were, “…not without hope that the following statement may help to prepare the way for the formation of such a Basis...and by showing the lines on which our Church thinks such a Basis might be formed...” (Presbyterian Church of Australia, *Minutes of Proceedings of the General Assembly of the Presbyterian Church of Australia* (Sydney: Samuel E. Lees, 1902.).

\(^{216}\) Uniting Church in Australia, *Basis of Union*, section 17. In this thesis I quote from the 1992 version of the original 1971 version of the *Basis*. The 1992 version uses inclusive language and contains section breaks which makes it easier to cite. It is the version currently in print for those wanting to verify the citations, and can be found in appendix one.
instrument through which Christ may work and bear witness to himself… (emphasis mine).\(^{217}\)

The authors of the *Basis* did not imagine that the final reconciliation of all humanity, or of all creation, was an event which would occur in history through human effort. It was an eschatological hope. Whilst the Uniting Church was committed to serving, “that end,” it would only be at the end of history, through a decisive action of God, that it would be achieved, for,

“The Church lives between the time of Christ's death and resurrection and the final consummation of all things which Christ will bring (emphasis mine) \(^{218}\).”

In the mean time, the whole church was in need of constant reform. This constant reform was to be guaranteed in two ways. From God’s side,

“Christ feeds the Church with Word and Sacraments, and [the church] has the gift of the Spirit in order that it may not lose the way.”

From the church’s side, at least within the Uniting Church, the key methodological commitment to ongoing reform is section eleven of the *Basis*, referred to above and quoted at greater length here,

“…In particular the Uniting Church enters into the inheritance of literary, historical and scientific enquiry which has characterised recent centuries, and gives thanks for the knowledge of God's ways with humanity which are open to an informed faith. The Uniting Church lives within a world-wide fellowship of Churches in which it will learn to sharpen its understanding of the will and purpose of God by contact with contemporary thought. Within that fellowship the Uniting Church also stands in relation to contemporary societies in ways which will help it to understand its own nature and mission. The Uniting Church thanks God for the continuing witness and service of evangelist, of scholar, of prophet and of martyr. *It prays that it may be ready when occasion demands to confess the Lord in fresh words and deeds… (emphasis mine).*”

\(^{217}\) Ibid, section 3.

\(^{218}\) Ibid.
This reflects the intention of the Joint Commission on Church Union (JCCU), expressed by one of its members, that,

“… we should be less concerned- in our bases of union- to define what the faith is than we are to describe where it is to be found. We should be less concerned with how orthodoxy is to be preserved and more concerned with how the springs of faith and obedience are to be renewed.”

This approach was reaffirmed at the 2000 Assembly, which resolved to,

“… encourage all Congregations to become learning communities, always seeking ‘the knowledge of God’s ways with humanity which are open to an informed faith’.”

The need for constant reform, for an informed faith, and for finding new words and deeds to express the faith reflects the Uniting Church’s reformed and Protestant roots. It is seen in the JCCU’s use of the classic Reformed approach to theology- the balancing of scripture, tradition and reason/experience.

Reformation churches are by nature committed to ongoing reform, that is,

“… steadily improving their creeds in the light of contemporary experience that brings a new perspective to the foundations of the tradition, retaining only so much of that classic faith as continues to prove adequate, and that often in reinterpreted form.”

The Basis itself points us to this triad, and expresses it in the metaphor of the church as a pilgrim people.

### 7.5 The church as a pilgrim people

The pilgrim metaphor was not invented in isolation, but emerged in the ecumenical circles to which the uniting denominations were deeply committed during their decades long negotiations for union. In 1953 Marcus Ward released a

---

220 Assembly resolution 00.28.07

book, “The Pilgrim Church: An Account of the First Five Years in the life of the Church of South India.” He does not use the phrase, pilgrim, in the book, but explains the title in the introduction. According to Ward, it was,

“… much in the minds of the members [of the Theological Commission of the Church of South India] that the Church of South India represented a venture of Christian reunion of a kind that had not previously been attempted. The new path now opened up called for great courage, faith in God, and trust in one another.\(^{223}\)

There was a sense of their church being “in via”. The word pilgrim was included in the title because,

“… a certain purpose and direction can be observed, not unworthy of the use of a word having so many Christian associations… whatever else may be said for or against the Church of South India, it is at least alive and on the march.\(^{224}\)

According to Dutney, Ward’s book, “was read throughout the Christian world and became a classic in the history of ecumenism.\(^{225}\)” Ward’s sentiments were echoed by Lesslie Newbigin, one of the architects of the Church of South India, and one of its first bishops. In lectures given the year before Ward’s book was published, Newbigin argued that, “... the Church must be seen as the company of pilgrims on the way to the end of the world and the ends of the earth,\(^{226}\)” and, in words which are echoed in the Basis,

“The Church is the pilgrim people of God. It is on the move – hastening to the ends of the earth to beseech all men [sic] to be reconciled to God, and hastening to the end of time to meet its Lord who will gather all into one.\(^{227}\)"

\(^{224}\) Ibid, p. 11.

\(^{225}\) Andrew Dutney, "We Are a Pilgrim People, Aren't We? (Notes from an Annual Lecture)," (Adelaide: c2003).

\(^{227}\) Ibid, p. 25.
In the following year at the World Council of Churches a major report included a long section headed, “The Pilgrim People of God.” That section said of the church,

“The Church, as a historical body, is made up of frail, ignorant, and sinful men [sic] …The Church fails of its calling when its members suppose themselves to have already attained that which awaits them only at the end of the way; when, blind to their faults and proud of their virtue and insight as Christians, they despise their fellow-men and speak self-righteously to the world; when they seek the glory of men and refuse the reproach of the Cross.”

Dutney reports that the image continued to be of importance at the World Council of Churches Assemblies in 1961 and 1968, the year that the final drafts of the *Basis of Union* were completed. It is not surprising, then, that the metaphor became a key one in the *Basis*,

“The Church lives between the time of Christ's death and resurrection and the final consummation of all things which Christ will bring; the Church is a pilgrim people, always on the way towards a promised goal; here the Church does not have a continuing city but seeks one to come. On the way Christ feeds the Church with Word and Sacraments, and it has the gift of the Spirit in order that it may not lose the way.”

Subsequent to the adoption of the *Basis*, McCaughey wrote that,

“There is nothing more important said about the Church anywhere in the Basis of Union than in these sentences. When Christians have thought that they are the kingdom of God… they have often been led to exaggerated claims for their institutional life together… Christians can, and frequently do, think too highly of their institutional life in the church; they can exaggerate their ‘spiritual’ life… The risen crucified One comes

---

229 Andrew Dutney, "We Are a Pilgrim People, Aren't We?,” (Adelaide: 2002?).

230 Uniting Church in Australia, *Basis of Union*, section 3. This was no doubt aided by the fact that McCaughey had already adopted the image himself by 1956 (Davis (J. D.) McCaughey, "Language About the Church," *The Reformed Theological Review* 15, no. 1 (1956): p. 5.)
to them to move forward: there is no independent life in the spirit available to Christians or the Church (emphasis mine).\textsuperscript{231}

The church has experienced, and expects, that as a pilgrim it will get lost, have to backtrack, and argue about the best way forward, often walking on different paths for a time\textsuperscript{232}. The \textit{Basis} therefore instructs the church on how to have a successful pilgrimage \textit{en route} to the promised inheritance.

### 7.6 Landmarks for the church’s map

If the church is a pilgrim, then a map for the journey would be extremely useful, or at least a knowledge of which landmarks to look for. George Lindbeck uses the metaphor of religions as maps\textsuperscript{233}. He argues that for a journey to be successful, a map needs to be of the relevant place, and sufficiently accurate. Even a perfect, map, however, does not guarantee success, as those on the journey must be able to interpret it correctly, and indeed must bother to use it in the first place. In contrast, a poor sketch map, with sufficient landmarks, in the right hands, may enable success\textsuperscript{234}.

Clive (C.S.) Lewis was convinced that such a map was essential,

> “Theology is like the map... Doctrines are not God: they are only a kind of map. But that map is based on the experience of hundreds of people who really were in touch with God-experiences... if you want to get any further, you must use the map... If you do not listen to Theology, that will not mean that you have no ideas about God. It will mean that you have a lot of wrong ones - bad, muddled, out-of-date ideas.”\textsuperscript{235}

\textsuperscript{232} The existence of denominations in the first place is evidence of this. The debates over the ordination of women, and sexuality, are two examples within the Uniting Church which will be explored more fully in chapter 7.7.

\textsuperscript{234} Ibid.

\textsuperscript{235} C. S Lewis, \textit{Mere Christianity} (Glasgow: Collins, 1977), chapter 23. Sourced from \url{http://www.mit.edu/~mcguyton/ABSK/MereChristianity/}
Rolston III claims that both science and religion use maps, though they are of different kinds, so it will be a considerable challenge to attempt to navigate by both. The possibility of success will be enhanced by a knowledgeable guide. The Basis affirms that the church has a guide. It has the gift of the Spirit in order that it, “may not lose the way.” The uniting denominations, however, had a healthy appreciation of the difficulties of following the Spirit. The Basis opens with the confession that the uniting denominations had, “never responded to God’s love with a full obedience.”

So, the church undertakes its pilgrimage with an imperfect map which is really just a list of landmarks with some hints as to how to orientate oneself by them. Even worse, the landmarks are described by people who have not themselves seen the destination, for they themselves were pilgrims on the way. The map is accompanied by a guide who the church often misunderstands or fails to listen to. Yet the Basis is confident that this combination will get the church where it needs to go, since, “The whole work of salvation is effected by the sovereign grace of God alone.”

The image of an imperfect map fits well with the intentions of the authors of the Basis of Union. As Dutney, a prolific scholar of the Basis observes,

“… openness to future, and freedom, were in the first draft, but became hallmarks of the second… the union was seen to be less of a goal, the summit to be reached after years of negotiation, and more of a jumping off point…anticipating a ‘continuing renewal’.”

“The critics were quite justified in claiming that acceptance of the Basis would cost something in terms of the definitive statement of doctrine… it was not the kind of prescriptive summary of belief which had traditionally served to safeguard the ‘truth’ and impeach the ‘mistaken’… The Basis defied those who searched it for a neat set of beliefs.”

---

237 Uniting Church in Australia, Basis of Union, section 1.

238 Dutney, Manifesto for Renewal, p. 98.

239 Ibid, p. 106.
Dutney’s analysis is supported by McCaughey, whom I cited on page 42, and quote more fully here,

"...we should be less concerned- in our bases of union- to define what the faith is than we are to describe where it is to be found. We should be less concerned with how orthodoxy is to be preserved and more concerned with how the springs of faith and obedience are to be renewed… ours is unlikely to be the generation (if any is) which will articulate the faith again in its fullness… What we can hope to do in common is to point men [sic] to the means and places of renewal of faith, and supremely through it all to Him who is the ground and means of faith, its author and finisher.\textsuperscript{240}"

At a bare minimum the \textit{Basis} tells us that the landmarks are the biblical witnesses, and the Apostle’s and Nicene Creeds. People enter this pilgrimage through the sacrament of baptism, and are nourished by the sacrament of the Lord’s Supper as they journey.

Despite the \textit{Basis}’ commitment to ongoing organic unity, its writers were aware that the impetus for such mergers was rapidly waning amongst other churches. The broader ecumenical movement had since the 1950s prioritised interdenominational cooperation over organic unions. This attitude has been the dominant one within the Uniting Church also, from 1985\textsuperscript{241}, through 1988\textsuperscript{242} and 1991\textsuperscript{243}, and in current negotiations with Lutheran and Anglican churches to recognise each other’s ministries\textsuperscript{244}.

The drafters of the \textit{Basis} therefore included, in sections 9-17, a series of specific obligations which it laid upon members of the Uniting Church. These obligations, whilst not essential for a successful pilgrimage, are nonetheless expected of everyone who seeks to follow Christ from within the vision of the church outlined\textsuperscript{240}

Commission on Ecumenical Affairs, "Report to the 1988 Assembly," (1988), 2.4a-2.4d.

Documents relating to both bilateral discussions are available at http://assembly.uca.org.au/cunity/index.htm
in the *Basis*. They were included to keep the Uniting Church on track until the next act of union requires a new *Basis* to be written.

The JCCU was adamant that this “track” was to be not just an amalgamation of the three pre-union traditions, but something altogether new⁴⁴⁵. At the same time, each uniting denomination had theological insights which they valued. So, neither wanting to abandon their heritages, nor to allow them to constrain this new undertaking, the *Basis* listed several key reformation documents, and selected sermons of John Wesley. Its members would be expected to refer to them, but not required to assent to them. It could hardly be otherwise, since there are some very obvious theological contradictions amongst the documents⁴⁴⁶ as we shall see in more detail in chapter 7.8.2.

Not only the reformation witnesses and creeds, but even the biblical witnesses themselves have qualified authority in the life of the Uniting Church. Their authority is subordinate to the authority of Christ, to whom they bear witness. This reflects that reality that they are witnesses, not agreeing on all points. In order to show that our ability to listen to the sciences is not restricted by the need to affirm all of the propositions in the biblical witnesses, I shall now show that the Uniting Church has, in theory, a non-literalist, non fundamentalist approach to the scriptures. I then provide two case studies of the approach the Uniting Church *does* take, in relation to the ordination of women, and of gay and lesbian ministers.

### 7.7 Scripture (the biblical witnesses)

The Uniting Church takes the biblical witnesses seriously. They are an indispensable part of Christian life,

> “… the Church has received the books of the Old and New Testaments as *unique prophetic and apostolic testimony*, in which it hears the Word of God and *by which its faith and*  

⁴⁴⁵ See JCCU quote on page 42.

obedience are nourished and regulated. When the Church
preaches Jesus Christ, its message is controlled by the Biblical
witnesses. The Word of God on whom salvation depends is to be
heard and known from Scripture appropriated in the
worshipping and witnessing life of the Church. The Uniting
Church lays upon its members the serious duty of reading the
Scriptures, commits its ministers to preach from these...
(emphasis mine). 247

The biblical witnesses have a unique, nourishing, regulating, controlling role in
the life of the church. Their message is not to be known by individuals as much
as worshipping communities. On a first reading, we seem to be left with little
freedom in discovering who Jesus is apart from the biblical witnesses, or for our
ministers to talk about Jesus apart from what is contained therein.

The Basis is very careful, however, to sublimate the authority of the biblical
witnesses under the authority of the living Christ, who continues to communicate
with us today. “Christ who is present when he is preached among people is the
Word of the God who acquits the guilty.” 248 The Basis carefully identifies the
Word of God with Christ, and avoids using that term for the biblical witnesses in
section 5. The biblical witnesses regulate rather than control or define our faith.
They point to the Word rather than being the Word. They are specifically
mentioned in the plural, they are witnesses, that is, they may not agree on
everything. McCaughey gives us an insight into what was meant by “control,”
and its limitations,

“The Church's message [preaching] is controlled by the Bible,
but the Bible's control over her theological statements is less
direct: theology today has to deal with many questions of which
the Biblical writers were not aware... let it be the whole Biblical
witness in its diversity and variety.” 249

247 Uniting Church in Australia, Basis of Union, section 5.

248 Ibid, section 4. This sentence was misprinted in the 1992 version as “... is the Word of
God...” and appeared widely on the internet in that form. The mistake was only noticed in c2004,
and corrected in the edition of that year. The meaning of the sentence is not changed by the error.
In either rendition Jesus is the Word of God, what differs is who acquits the guilty, the preface to
the 1971 version of the Basis makes this explicit (Joint Commission on Church Union, The Basis

This lead the JCCU, on drafting the 1971 version of the *Basis*, to comment that the *Basis* was not an appropriate place to attempt a new definition of the authority or inspiration of scripture\(^{250}\). This appears to have been said in defence against demands for such a definition by some members. This issue was partly responsible for the refusal of one third of Presbyterian congregations to enter into union\(^{251}\). Since all Methodist congregations were obliged to join when the majority voted in favour of union, the Uniting Church ended up with a significant number of members who were unhappy with what the *Basis* said about the scriptures. As Peter Blackburn, who has been actively involved in the leadership of both the Evangelical Members of the Uniting Church (EMU) and the National Fellowship for Revival within the Uniting Church (NFFR) put it,

> “Those of us from within the conservative evangelical tradition have probably never been entirely happy with paragraph 5, not so much in what it says, but in what it fails to say about the Scriptures. There is no clear, direct statement that the Bible is the Word of God, such as the earlier documents from the three uniting Churches have affirmed...\(^{252}\)”

So the church is that community which acknowledges Christ as the Word of God, that accepts the authority of the biblical witnesses to control what can be preached about Christ, and that actually uses these witnesses in its worship and witness\(^{253}\).

Within the church, the Uniting Church commits itself to approach the biblical witnesses in the light of its methodological commitments of section 11 of the *Basis*, described above. Typical of the rest of the *Basis*, section 11 speaks in broad terms rather than narrow prescriptions. It says how the Uniting Church will

---

\(^{250}\) Joint Commission on Church Union, *The Basis of Union (1971 Revision)*, p. 6. It was also in the 1971 version that the clause allowing freedom in matters not relating to the “substance of the faith” was added.

\(^{253}\) In chapter 7.7 I will examine the specific additional commitments of the Uniting Church regarding its use of the biblical witnesses, and what this has meant in practice in the consideration of contentious issues.
read the biblical witnesses, rather than defining what they say. Even then, although the *Basis* commits the Uniting Church to enter into the inheritance of, “literary, historical and scientific enquiry,” it does not specify which schools of thought within those disciplines are correct.

This reflects the commitment of the Joint Commission on Church Union that,

> “The Church will therefore guard against allowing that which is necessary but secondary to play a dominant part in her life. No system of church government, no rules or precedents, no system of doctrine or ethics… Is sufficiently free from error to be permitted to hold anything but a subordinate position in the life of the Christian Church… in the church there must be that which conserves the faith, and… that which subjects our statements of the faith to radical criticism… The church in each generation will pray that it may be given to those who follow to state the faith more surely”\(^254\).

This commitment is paraphrased almost exactly in a statement of faith circulated for use in all Uniting Churches in 1998\(^255\). Although it does not promote a particular school of thought, section eleven of the *Basis* clearly rules out biblical fundamentalism or literalism. Indeed, McCaughey drafted it in response to a letter by Maynard Davies, which pointed out that,

> “…fancy and sub-Christian sects inevitably appeal to the Bible for their justification… [therefore]… We shall have to define our attitude more clearly… We shall be very wary of isolated proof-texts considered apart from the whole gospel… Nor shall we dismiss modern scientific thought…”\(^256\).

The Uniting Church, then, is a non fundamentalist, non literalist church. Although the way in which the *Basis* describes the biblical witnesses, and its use of them, was controversial, it flowed naturally from the way in which the pre-union churches operated. A clear example of their non-fundamentalist approach

\(^254\) Joint Commission on Church Union, *The Faith of the Church*, pp. 44-45.

to scripture, for example, was that they all ordained women before union\textsuperscript{257}, and women’s eligibility for ordination was written into the \textit{Basis}.

“The Uniting Church, from inception, will seek the guidance of the Holy Spirit to recognise among its members \textit{women} and men called of God to preach the Gospel, to lead the people in worship, to care for the flock, to share in government and to serve those in need in the world (emphasis mine).\textsuperscript{258}"

All people in specified ministries in the Uniting Church are required to affirm their willingness to work with women in leadership. This requirement was challenged, unsuccessfully, as documented by Rodney Smith\textsuperscript{259}. The Assembly Standing Committee therefore undertook to commission a comprehensive defense of women’s ordination for its own dissenters, and for other denominations, the overwhelming majority of which rejected the practice. The biblical and theological reasoning which lead the Uniting Church to ordain women is contained in a document approved by the Assembly Standing Committee in 1990\textsuperscript{260}. The document was prepared by the Social Responsibility and Justice Committee (SR&J) of the Assembly Commission for Mission\textsuperscript{261}. This, and the history of debates about sexuality in the church, serve as effective case studies for the way in which the biblical witnesses are understood to nourish, regulate and control the church’s theology and practice.

\section*{7.7.1 The biblical witnesses and the ordination of women}

The SR&J document, “Why Does the Uniting Church in Australia Ordain Women to the Ministry of the Word?” argues that, for the Uniting Church,

\textit{“the fundamental question… is therefore not, ‘What did the New Testament writers think about this…The fundamental

\textsuperscript{\textsuperscript{257}}The Congregationalists ordained their first woman minister in 1926, the Methodists in 1968 and the Presbyterians in 1974.

\textsuperscript{\textsuperscript{258}}Uniting Church in Australia, \textit{Basis of Union}, section 14.

\textsuperscript{\textsuperscript{260}}Assembly Standing Committee Minute 90.32.7.

\textsuperscript{\textsuperscript{261}}Social Responsibility and Justice Committee (Assembly Commission for Mission), "Why Does the Uniting Church in Australia Ordain Women to the Ministry of the Word?,” (Sydney: The Uniting Church in Australia, 1990).
question … is rather, ‘What is the gospel of Jesus Christ?’ (emphasis theirs).

The report does not ignore the scriptures, indeed the largest section is a survey of biblical passages. In line with section eleven of the Basis, however, the report uses the tools of critical biblical scholarship to take a scholarly approach to the biblical witnesses. This approach leads them to conclude that,

“… the New Testament does not speak with one voice on the question of the place of women in the Church. We do not think it either helpful or honest to harmonize or obscure these contradictions. They help to remind us that the New Testament is not a textbook of systematic theology, still less a code of Church law, but rather a collection of occasional writings from the Church’s formative period which provides us with windows into a number of different early Christian communities. The New Testament will not relieve us of the necessity to make our own faith decision, under the guidance of the Holy Spirit (emphasis mine).

The committee is able to acknowledge the contradictions amongst the biblical witnesses because, unlike fundamentalist churches, they are not trying to follow the teaching of the Bible. Instead,

“…our ultimate authority is not the letter of scripture but rather Christ himself, the living Word of God, to whom scripture bears witness and who speaks through it.

Because there are contradictions amongst the biblical witnesses, even these must submit to the authority of Christ and the gospel,

“… some of the New Testament’s utterances on the role of women in the Church arise directly from reflection on the gospel, whereas others are prompted primarily by a prudential concern for the Church’s image in society, [therefore] priority should surely be given to the former.

262 Ibid, p. 10.
263 Ibid, pp. 18-19.
264 Ibid, p. 25.
265 Ibid.
This Uniting Church approach to the scriptures brings the committee into conflict with the teachings of the early church, as shown in the committee’s survey of teachings from 100-500 AD. In this period the men in leadership unanimously and repeatedly prohibited the leadership of women. For example, Origen (c185-c254) taught that, “…it is not becoming for a woman to be a teacher of men.”

The Didascalia, written in the early third century, affirmed that, “It is neither right nor necessary that women should be teachers and especially concerning the name of Christ…” As John Chrysostom (c. 344-407) put it, “woman [=Eve] taught once, and ruined all.” The committee concludes,

“It is clear that the reason why the Fathers restricted the role of women was a desire to follow commands and precedents in the scriptures. This desire lead them to restrict the role of women much more than contemporary Greek society and some of the heretical sects did. If we read the same Bible that they read and come to different conclusions, it is because we read the Bible not as a book of commands and precedents, but as apostolic witness to Christ (emphasis mine).”

It may also be true that the conclusions differ to some extent because the Fathers chose to emphasise different passages than the committee, but without doing so explicitly, perhaps because their own gender bias prevented them even seeing the other passages for what they were.

In response to this approach to scripture and church tradition, the committee acknowledged that,

“…we hear words of astonishment directed to us. Some of these words come from other traditions of the universal Church. Others come from people within our own tradition who continue to be troubled about the ordination of women. Some voices say, ‘Who are you to depart from God’s directions in the New Testament that women should keep silent in Church? Other

---

267 Ibid.
268 http://www.womenpriests.org/traditio/chrysos.htm
269 Social Responsibility and Justice Committee (Assembly Commission for Mission), "Why Does the Uniting Church Ordain Women?," p. 28.
voices say, ‘Who are you to depart from the universal practice of the Church through almost all of its history?’

The committee responded,

“…we express a fundamental astonishment that Christ’s Church would offend against the Saviour’s suffering love for all people, by claiming that no women are called by God to the ministry of the Word… We would argue that the matter of the ordination of women would be as close to the ‘substance of the faith’ as for example, the ordination of black persons…”

“We therefore declare [that] ordaining both women and men… is fully in accordance with the gospel of Jesus Christ, and we beseech those members of other churches, or even of our own church, who have not yet reached this conclusion to think again.”

The frank acknowledgment that even some of the Uniting Church’s own members were not comfortable with the ordination of women, or the committee’s approach to scripture did not stop the Assembly from approving the report. A similar tenacity in the face of grass roots opposition from some quarters is seen in the ongoing debates about sexuality.

7.7.2 The biblical witnesses and sexuality

The debate over sexuality, specifically the ordination of gay and lesbian ministers, provides a more contentious case study of the Uniting Church grappling with the biblical witnesses at an Assembly level. In 1981 the Assembly Standing Committee was asked to rule on whether homosexuality was a bar to ordination. They determined that homosexuality in itself was not, and has not been, a bar to ordination in the Uniting Church. The ensuing outrage from more conservative members of the church led eventually to the formation of the

274 ASC Minute 82.12
group, the *Evangelical Members of the Uniting Church (EMU)*. In their doctrinal statement they assert,

“The divine inspiration and dependability of Scripture as *the supreme authority* in all matters of Christian faith and conduct. The Scriptures contain the historical basis for our faith and that an honest and holistic reading of *Scripture will teach us God's principles* which enable us to live life to the fullest (emphasis mine).”

In this affirmation they appear to contradict the *Basis of Union*, which attributes sole authority to Christ, the Word of God. This may reflect the sort of conflation of the authority of scripture and Christ which, as we have already seen, some members of the Uniting Church wished the *Basis* had expressed. This approach was exemplified in the Queensland Synod, which in 1984 expressed, “…its belief that homosexual relationships do not fulfil *the Biblical norm*, (emphasis mine)” and, “Requests the Assembly Standing Committee to issue a definite statement on homosexuality at the appropriate time.”

In 1985 the Queensland Synod claimed, “That homosexual behaviour stands *condemned in scripture* and is sinful (emphasis mine).” On this “scriptural basis”, it passed a resolution in 1991 that, “… responsible sexual behaviour is expressed by celibacy in singleness and loving faithfulness between a man and a woman in marriage.” This summary of sexuality is routinely abbreviated, CISAFIM. Interestingly, their policies were approved a year after the booklet defending the ordination of women, which completely rejected the approach to scripture used to defend the Qld policies. Since the booklet was endorsed by the ASC as representing the church’s biblical and theological reasoning, it would

275 EMU is an organisation formally recognised by the South Australian Synod, but operates as a national network. They have become the group which represents conservative concerns in various ASC consultations on sexuality.

277 Page 42.

278 Resolutions of the Queensland Synod 84.204(c) and 84.205(e) respectively.

279 Resolution 85.65(b).

280 Resolution 91.117(g).
appear that the Queensland Synod clearly fell short of Assembly expectations for biblical scholarship. In another paper I examine the discomfort of some Uniting Church conservatives with the ordination of women, particularly as it undermines the argument against the ordination of homosexuals. In 1996 the Queensland Synod sought national support for its resolutions, asking the 1997 Assembly to affirm, “… that homosexual practice is contrary to the teaching of Scripture which has been affirmed by the church historically and ecumenically.” The Synod also urged Assembly to adopt CISAFIM as a national policy, asking Assembly to resolve that, “Christ calls and empowers us to be celibate in singleness and faithful in marriage.” Some other Synods, along with EMU, brought similar resolutions.

The sets of motions seeking to limit sexual freedom were in response to Assembly Task Group on Sexuality report and recommendations to the 1997 Assembly. This report, amongst other things, rejected CISAFIM as simplistic. This view was echoed by several of those who spoke from the floor during the debate on the report, and the Assembly declined to endorse those resolutions which sought to impose CISAFIM on Uniting Church members. Assembly also declined to endorse the statements about scripture being made by the Queensland Synod.

The same Assembly affirmed the recommendations of the Commission on Women and Men, which used the language of the sexuality report to affirm that,

---

282 Resolution 96.113(a).
283 Resolution 96.113.
286 Personal recollections of the first day of the 1997 Assembly, Perth.
“... we express our sexuality as the embodiment of God’s creation in ways that honour God and honour each other, through right and just relationships.”

Assembly received the Sexuality Report as a resource for the church and accepted the Task Group’s recommendation to create a group, “… to prepare and make available material on ways in which the Church understands and uses the Bible in seeking to live in faithfulness to the Gospel.” Note that the Assembly did not seek a group that would uncover biblical norms or rules for sexual relationships and ethics.

As a result, the Task Group on the Understanding and Use of the Bible (TGUUB) was convened and made its report to the 2000 Assembly, having been asked to,

“(a) identify the wide range of approaches to the Bible …
(b) highlight the ways in which various ethnic and cultural contexts shape understandings of the Bible…
(c) encourage spiritual and scholarly study of the Bible (cf. Basis of Union, paragraphs 5 and 11)…” (emphasis mine).

The group believed itself to represent, “the diversity of theological approaches within the Uniting Church.” Not surprisingly, then, they acknowledged that, “those who were looking for one simple answer to the dilemmas that led to our formation, will be disappointed.”

---

287 Gospel and Gender, Made in the Image of God [web document] (The Uniting Church in Australia, 1999 [accessed 17 July 2003]). On page 2 the document refers to the fact that, “research and discussion around sexuality and our expression of this sexuality within right and just relationships,” was the context of the resolution on expressing sexuality. That is, sexuality implies one’s sexual orientation and activity, rather than one’s gender (The Commission for Women and Men was renamed Gospel and Gender).

288 Assembly Resolution 97.31.14.

290 Ibid, C29-1.

291 Ibid.

The task group members did agree that, “The Church is not the Church without the Bible,” and that,

“We must cultivate a piety of the Word that respects Scripture more as a source of life than as a set of right answers to be applied to whatever problem we choose.”

Assembly commended the report to congregations and presbyteries for prayerful consideration and action, whilst affirming,

“…the centrality of reading and studying the Bible for the enhancement of every aspect of the life of the Uniting Church.”

While the TGUUB was developing its report, a national retreat called Moving Ahead with Diversity was held. The resulting Statement on Unity and Diversity was adopted by the 2000 Assembly and affirmed in part,

“…the authority of the Scriptures as defined in the Basis of Union, acknowledging that within the church there is a range of views on questions of Biblical interpretation on various matters of Christian faith and practice (emphasis mine).”

The Assembly met again in 2003 and passed a resolution, number 84 on the agenda, which affirmed that the status quo in the Uniting Church did not explicitly proscribe homosexual relationships, nor endorse any particular sexual ethic, partly because of differences in the interpretation of the scriptures,

“… we affirm the authority of the Scriptures as defined in the Basis of Union, acknowledging that within the Church there is a range of views on questions of Biblical interpretation on various matters of Christian faith and practice... within the Church people of faith have wrestled with integrity to interpret Scripture in relation to the issue of Christian sexual ethics and have on some issues come to mutually exclusive positions…”

294 Assembly Resolution 00.29.03.
295 Assembly Resolution 00.29.02.
296 Assembly Resolution 00.25.03.
297 This is the slightly amended version of Resolution 84, released by the Assembly Standing Committee in response to some confusion amongst congregations about the meaning of specific phrases (Terence Corkin, Membership, Ministry and Sexuality (Proposal 84) [internet] (2003
The resulting furore, particularly in Queensland, when people realised that the Uniting Church did not *de facto* prohibit the ordination of homosexual ministers is worthy of a PhD in itself. Suffice to say that many members of the church, despite the *Basis of Union*, do indeed hold a fundamentalist and literalist view of the scriptures. As Dorothy McRae McMahon, former director of Mission in the Assembly, put it in an “open letter to the doctors of the church,”

“…we have a largely precritical, semi-literalist church membership. This means that when we face some of the key ethical and missional issues of our day, we are not equipped to do so. It means that we are heading towards the 21st century with something more like a 19th century view of Scripture. It means that in much of the church we dare not ask the questions which need to be asked and we are unable to face mature relationships with the community around us.”

At the time of submission of this thesis EMU and a new group, *Reforming Alliance*, continue to seek ways to either force the church to affirm CISAFIM as a requirement of ministers, or at least to set up structures through which they will be enabled to do so while remaining, on paper at least, part of the Uniting Church.

All Synods since Assembly have affirmed the legitimacy of proposal 84, and the president has reaffirmed both the proposal, and the inability of presbyteries to *a priori* rule out ordaining candidates on the basis of their sexuality299. I shall not elaborate on the largely political responses to the proposal any further in this thesis. Andrew Dutney, however, speaks for many when he admits that,

“Sometimes it feels as though it would be easier for everyone if we just treated the Bible as God’s instruction book- do this, don’t do that.”

But as he goes on to say,

“… we couldn’t do that and be the Uniting Church.”

So, there is no such thing in the Uniting Church as a biblical theology which cannot be challenged, or an ethic which can be defended simply because it is “biblical.” No proposition in the biblical witnesses is infallible, and therefore no theological proposition, even one derived directly from scripture, is beyond rejection in the light of new information and the guidance of the Spirit, as we seek to confess the Lord in fresh words and deeds. If the biblical witnesses are to be approached in this way, then it should be of no surprise that the Basis explicitly prevents the Uniting Church from adopting an authoritarian approach to the historic creeds of the church.

7.8 Tradition

7.8.1 The Apostles’ and Nicene Creeds

The final landmark laid upon the whole pilgrim church is the need to refer to the Apostles’ and Nicene creeds. According to the Basis, the Uniting Church receives them in a specific way,

“The Uniting Church receives these as authoritative statements of the Catholic Faith, framed in the language of their day and used by Christians in many days, to declare and to guard the right understanding of that faith (emphasis mine).”

The Assembly Working Group on Doctrine comments thus,

“The creeds represent a launching pad for belief rather than a coercive straightjacket. (The Basis is very clear that they are framed in the language of their day). We live within them rather than obey them from a distance. Our lives are shaped by the tradition as we explore it, question it, allow ourselves to be questioned by the wisdom of those who went before us.”

---

300 Dutney, Where Did the Joy Come From?, p. 37.

301 Uniting Church in Australia, Basis of Union, section 9.

The Uniting Church, then, is not to be bound by the letter of the creeds, but to question and be questioned by them. It follows that Uniting Church ministers will be required to accept the, “… discipline of interpreting their teaching in a later age (emphasis mine).” Having been duly interpreted, the creeds are commended to ministers and congregations for, “instruction in the faith, and … [use] in worship as acts of allegiance to the Holy Trinity.”

So, the creeds are not to be used as a, “coercive straightjacket,”303 but they are to be used.

7.8.2 The Reformation Witnesses and Wesley

A number of documents which were important to the identity of the denominations entering union are mentioned in the Basis. The Presbyterians contributed the Scots Confession of Faith (1560), the Heidelberg Catechism (1563) and the Westminster Confession of Faith (1647). The Congregationalists brought a revised version of the Westminster Confession, called the Savoy Declaration (1658). The Methodist did not contribute a confessional document, but rather the Forty-Four Sermons of Wesley (1793)304.

Unlike the Basis305 the various declarations and confessions it mentions were written precisely to define the faith and impeach the mistaken. The Scots Confession, for example, claimed to be, “The confession of faith professed and believed by the Protestants within the realm of Scotland.”306 The prescriptive nature of the document is emphasised in the opening words of its chapters, for example,

“We confess and acknowledge… For this we constantly believe… We most constantly believe that… We undoubtedly believe… We do not at all doubt… This is our faith…”307

303 Ibid.
304 Wesley preached many more sermons, but forty-four were compiled for use in the Methodist church in 1793.
305 Dutney, Manifesto for Renewal, p.106.
307 Ibid.
The Heidelberg Catechism is a list of questions about faith addressed to members of the church. The purpose is not to discover the members' beliefs, however, but to tell them what their beliefs are. A series of 129 “questions” and accompanying proof texts closely define what the faith is. For example,

“7. Q. From where, then, did man's [sic] depraved nature come?
A. From the fall and disobedience of our first parents, Adam and Eve, in Paradise (Gen 3) for there our nature became so corrupt (Romans 5:12,18,19) that we are all conceived and born in sin (Psalm 51:5).”

The Westminster Confession of Faith was approved by Scottish Parliament in 1649 and became the, “… chief doctrinal standard of English-speaking Presbyterian Churches throughout the world, including the Presbyterian church of Australia.” Its propositionalist and detailed approach to doctrine is similar to that of the Scots Confession.

The Congregationalists’ classic doctrinal expression is found in the Savoy Declaration, a modified form of the Westminster confession produced in England. Although the two documents agree theologically on almost all points, their contradictory attitudes to church government is seen in the deletion of chapter 30 (on the power of the church to censure), and chapter 31 (on the legitimacy and powers of Synods and councils) from the Savoy declaration. So, although the Congregationalists and Presbyterians had somewhat different theologies, their approach to theology was the same.

The Methodists contributed a collection of forty four of Wesley’s sermons. From 1763 preachers in Methodist preaching houses were required to,

“… preach no other doctrine than is contained in Mr Wesley’s Notes upon the New Testament, and four volumes of sermons.”

---

308 The Heidelberg Catechism (1563) reproduced in full in Ibid, p. 88.

310 Ibid, p. 177. The ‘four volumes of sermons’ were the 44 sermons, although Wesley subsequently added an additional nine. British Methodists acknowledge the 44 sermons as
The difference between Wesley’s sermons and the above declarations and catechisms is that the sermons are, “aimed at awakening and reviving faith, not … declaring what it believes nor to systematic instruction in the faith”\(^{311}\). Wesley’s sermons were not scholarly treatises, but were aimed at lay listeners and non Christians\(^{312}\).

Wesley’s theology is irreconcilable with the Presbyterian and Congregationalist views at certain points, most notably in the controversy over the notion of predestination. This was a key assumption of John Calvin, whose theology undergirds the Westminster Confession\(^{313}\). It was totally rejected by Wesley, who preached that salvation was possible for everybody\(^{314}\).

It is clear that three denominations with such different attitudes to church government, and even central doctrines of the faith could not simply be amalgamated by requiring their members to now believe all of the historical witnesses of each denomination.

Fortunately, the Joint Commission rejected such an approach from the outset. What the \textit{Basis} had to do was point people to where the faith could be found, not to define the faith. It did not have to make a decision about predestination. The \textit{Basis} therefore points Uniting Church members to all of the documents, irreconcilable as they are in places. Ministers and instructors are not required to believe or confess everything them, but must \textit{study} them. They must study them for a specific purpose,

---

\(^{311}\) Owen, ed., \textit{Witness of Faith}, p. 177.

\(^{312}\) Though the latter may have been somewhat put off by being addressed, for example, as, “thou vile, helpless, miserable sinner!” in the last paragraph of sermon five- \textit{Justification by Faith}.

\(^{313}\) Busch, \textit{The Future of Our Past}.

\(^{314}\) In pleasant contrast to Calvin and other reformers, Wesley is persistently moderate in his descriptions of those he disagrees with inside the church. See for example sermon 33- \textit{A Caution Against Bigotry} (Wesley, \textit{Collected Sermons of John Wesley from the 1872 Edition}).
“... so that the congregation of Christ's people may again and again be reminded of the grace which justifies them through faith, of the centrality of the person and work of Christ the justifier, and of the need for a constant appeal to Holy Scripture (emphasis mine).”

The need for constant appeal to Holy Scripture is already implied in section five of the *Basis*, and the centrality of Christ in section three. The proposition that Christians are justified by grace through faith is a hallmark reformed doctrine, as is the role of Christ as justifier. Exactly what justification means in a theology which integrates evolution and cosmology will be explored later.

The limiting of the authority of the biblical witnesses, creeds and Reformation Witnesses demonstrates the Uniting Church’s commitment to remain open to constant reform. As a community it is therefore theoretically well placed to enter into the investigations necessary to rethink its nature and mission in the light of scientific discoveries, and to confess the Lord in fresh words and deeds.

The legacy of scripture and tradition led the *Basis* to affirm some key Christian propositions about the nature of God and Christ, and our response through baptism into God’s mission on Earth. There has already been considerable debate on these issues within the life of the Uniting Church, which gives us a sense of how much freedom various ministers and leaders believe the *Basis* gives them in interpreting core Christian propositions. Chapters 9 and 10 focus on the extent to which these propositions may or must be further reworked.

In a nutshell, this is the story we will be seeking to integrate with the scientific one; Those who wish to be Christian must undergo a *baptism* into a church which worships *God as Trinity*, the *loving Creator* whom we meet in *Christ the Word of God*, known through the *biblical witnesses*, guided by the *Creeds* and *Reformation Witnesses*, following the *Spirit who guides us*, being sustained by our sharing in the *Lord’s Supper* as we journey on *mission with God*.

---

315 Uniting Church in Australia, *Basis of Union*, section 10.
The last phrase is a key one within the life of the Uniting Church. We do not do theology simply because it is interesting, but so that we may more fully understand the nature of God, our world and ourselves, and thus enter more effectively into mission. Uniting Church theology is expected to have practical consequences. The integrative project of this thesis is, in part, an attempt to more fully understand and therefore enter into God’s mission in the world.

In order to participate in mission in a manner consistent with what we are learning about creation, and by implication the Creator, we must integrate the new insights from the sciences into our understanding of (and ongoing arguments about) these aspects of Christian life.

7.9 Reason- contact with contemporary thought

We have already seen the commitment of the Uniting Church to dialogue with contemporary knowledge, in other words, to reason. What we understand about God and the life of faith is illuminated by the biblical witnesses, and previous reflection on them in the traditions of the church, but their conclusions must still make sense to us in our own day, in the light of the knowledge which we have but our forebears did not.

In chapter 8, I attempt to engage with a tiny piece of this knowledge, by outlining the story of creation as told by the most relevant sciences: cosmology, evolutionary biology and ecology. I do not, however, give equal attention to each of these. I consider cosmology in sufficient detail only to produce a brief, non-controversial scientific picture of the context in which the story of life on Earth sits. Cosmology tells us about the enormous size, age, and future of the universe. This builds our picture of the Creator of the universe, and the probability that there is life beyond that on Earth with which the Creator would also be concerned.

Evolutionary biology (and the sciences which undergird it, like genetics and palaeontology) is examined in more detail, because it has received less attention, especially recently, than other disciplines. There is much written about the impact of cosmology on theology, particularly in the reinvigoration of the idea of the
cosmic Christ. There is also a large body of eco(logical)-theology\textsuperscript{316}. Yet this ecotheology is rarely located within the evolutionary history of Earth. As I have already shown, there is no theological reflection on evolution in any of the resources released by Assembly. This lack of attention to evolutionary biology is highly problematic, because of the enormous consequences of the evolutionary development of life on Earth for theology,

“… the natural sciences now more than ever before pose a huge and direct challenge to religious and, specifically, theological reflection.\textsuperscript{317},”

Rolston, who is one of the few to engage with biological evolution, writes of his book,

"The most troublesome (and longest!) chapter is on biology, which is the science that most threatens advocates of religion, despite their frequent, all-too-easy reconciling of biology and God in evolutionary theism.\textsuperscript{318}"

Evolutionary biology tells us two things: the extremely short existence of human life on Earth, and the mechanisms by which all life came about, which itself tells us something about our relationship to the rest of creation.

There are several balancing acts in telling the stories of one set of disciplines in order to reflect on them from within another. The first is the tension between letting the sciences tell their own story, and wanting to highlight parts that seem particularly relevant and interesting to theology. Since many writers tend to restrict themselves to the latter approach, and thereby miss some important insights, I have tended to lean in the other direction, and my section on evolution is more extensive than any I have found in works of ecotheology. It may seem to the reader that much of what I have found essential to include, in order to paint an adequate picture of evolution, is not specifically addressed in the final theological

\textsuperscript{316} I hope to show that much of this takes a fairly shallow dip into ecology, being primarily preoccupied with its ethical manifestation, environmentalism.

\textsuperscript{318} Rolston III, \textit{Science and Religion}, p. v.
reflection. The fruit of this approach is seen in the discovery that the scientific story raises its own questions for theology to respond to, which were not raised by my survey of the Uniting Church stories themselves, exhibiting something of the mutually critical nature of dialogue highlighted by David Tracy\textsuperscript{319}. On the other hand, I am aware that there are many gaps in even my telling of the story, and much more that could be said. Given that the story is over three billion years long and spans the entire globe, I have learned to live with this.

The second balancing act is the tension between presenting the stories simply versus simplistically. There is a lot of controversy within cosmology, evolution and ecology on key issues. If theological reflection leans too heavily on any one scientific theory which is later falsified, it too will fall. On the other hand, there is significant agreement, and if theology does not engage with the theories in enough depth, the project is pointless. In telling the stories of science, then, I attempt to balance a desire for brevity and simplicity with the need to fairly represent the complexities and controversies in the story.

Having heard the scientific story of life as best I can present it in limited space, in chapter 9 I begin the task of integrating this story with theology. Although I focus on the anthropocentric and biocentric propositions I found in the Uniting Church material, it turns out that they neatly encapsulate almost the entire range of opinions found in the wider field of ecotheology. This is hardly surprising given the strong ecumenical commitments of the Uniting Church. It turns out, then, that a critique of Uniting Church ecotheology demonstrates some of strengths and weaknesses of the wider ecotheology movement. I therefore go on in chapter 10 to present a biocentric framework which builds on the strengths and addresses some of the weaknesses of this movement. Finally, I revisit the Basis of Union from this new biocentric perspective, seeking any signs of consonance between its vision and the biocentric one.

8 The scientific stories of life

Copernicus and Darwin instigated two major revolutions in our understanding of creation. Gould claims that the Copernican and Darwinian revolutions are the two greatest revolutions in scientific thought. Whether that is true generally, I believe that it is certainly arguable in relationship to the impact of science on theology. Gould is also surely correct when he states that the raw emotional impact of evolutionary theory exceeds that of the new cosmology. Cosmology, as Gould puts it, speaks mainly of real estate, whereas Darwinian evolution raises questions about the very “essence” of life. Ernst Mayr agrees, claiming that,

“No other scientific theory has challenged and, in fact, refuted so many commonly held beliefs as Darwin’s theory of evolution by natural selection… no other philosopher or scientist has had as great an impact on the thinking of modern man [sic] as Darwin.”

Certainly Darwinian evolution is still vigorously rejected by a considerable number of Christians. In Australia in 1991, 51% of churchgoers rejected evolution and believed that Earth was created in six days. The figure was only 31% for Uniting Church attenders, but 83% for Pentecostals in the Assemblies of God. Another third of Uniting Church attenders believed that Genesis and evolution could be reconciled in some way. In contrast, the cosmology which Copernicus spawned is almost universally accepted, without the need to reconcile it with the three tiered cosmology found in most of the biblical witnesses. This is, I believe, not because evolution is less scientifically persuasive, but because its implications for theology are seen to be much more far reaching.

Nevertheless, it is important to visit cosmology at least briefly, because it is able to tell us something of our place in the universe, whereas evolutionary biology restricts itself to our place on Earth.

---

8.1 The story of the universe

8.1.1 The scale of the universe (time and space)

Over the last 12-15 billion years, the known universe has expanded from probably a single point in space to a massive system 24-30 billion light years, or 144,810,000,000,000,000,000,000 kilometres across\(^{323}\). The universe contains at least 120 billion galaxies, each with hundreds of billions of stars\(^{324}\). Simon Driver of the Australian National University in Canberra and his team recently estimated that the number of observable stars in the universe is 70,000,000,000,000,000,000,000 (seventy sextillion). Two years ago I sat on a beach on Stradbroke Island wondering if there were as many stars in the universe as there were grains of sand on that beach. Just that one beach. Even that seemingly impossibly large number was, according to Driver, orders of magnitude too little. There are ten times more stars than there are grains of sand on the entire Earth, including beaches and deserts\(^{325}\). By contrast, the maximum number of stars which lead the writer of psalm eight to wonder at work of God’s fingers was about two thousand\(^{326}\). Whilst the biblical witnesses often attest the inscrutability of God\(^{327}\), the magnitude of this inscrutability is only now becoming apparent.

---

\(^{324}\) Anonymous, *Stargaze: Hubble’s View of the Universe DVD* (Alpha DVD, 2000), DVD.

\(^{326}\) This is the maximum number of stars observable with the naked eye at any one time from any one place on earth, (Anonymous, *Star* (Microsoft Encarta Online Encyclopedia, 2004 [accessed 4 October 2004]), available from http://uk.encarta.msn.com/encyclopedia_761557483/Star.html.) The total number of stars visible by the naked eye from earth is only five thousand (Beale, *Number of Visible Stars Put at 70 Sextillion*.)

\(^{327}\) For example Job 38:41; Romans 11:33-34; 1 Cor 13:12.
How was this massive universe created? Nobody know the exact details, but we do know that the physical processes with extremes way beyond human experience. The universe from its beginnings experienced winds of tens of millions of kilometres per hour, and temperatures in excess of a million degrees Celsius. Such was the nature of creation that life had no possible chance of establishing itself for the first billion years of turmoil. From the stars that formed there were eventually spawned planets such as our own. Then the planets either spawned, or captured, moons for themselves. Our moon was formed when a gigantic comet collided with Earth, creating a massive exit wound.

Recent information from the Hubble Space Telescope suggests that spawning of planets was a common event, and that planets are ubiquitous throughout this really, really enormous universe. Driver and others are confident that at least a tiny fraction of these planets would be able to support life, but that the vast distances involved mean that we will never see even traces of it. Mayr explains in greater detail the reasons against ever expecting to contact extraterrestrial intelligence. If there is other life in the universe, it may be much more ancient than life on Earth, since planets started forming within a billion years of the Big Bang. We also know that at least some of these planets will exist long after

---

328 Anonymous, *Stargaze: Hubble's View of the Universe DVD*. There are more italics in this section on cosmology than anywhere else in this thesis, and perhaps more than literary convention would suggest desirable. If the numbers involved sink into our consciousness, however, I do not see what alternative there is. Indeed, bold italics in a larger font are probably required, but I have resisted the temptation. Edwards quotes 10 to the power of 32 Kelvin as the initial temperature of the universe, but provides no reference (Denis Edwards, *Creation, Humanity, Community: Building a New Theology* (Dublin: Gill and Macmillan, 1992), p. 35.)

329 Initially a ring of fragments was created, which gravitated towards each other and formed the moon as they cooled (Martin Leipzig, *From Earth to Moon* [internet] (1999 [accessed 30 May 2003]), available from http://www.skeptictank.org/hs/lomarty.htm.)

331 Beale, *Number of Visible Stars Put at 70 Sextillion*.

332 Mayr, *Toward a New Philosophy of Biology: Observations of an Evolutionist*, pp. 67-74. His arguments against contacting extraterrestrial life are still valid, even though his expectations of the existence of alien life forms is too conservative. He suggests there may be hundreds of millions of stars in the universe, not 70 thousand million, million, million.

333 A popular article on this discovery is John Noble Wilford, *Hubble Telescope Detects Planet Formed 13 Billion Years Ago* (2003 [accessed 24 November 2004]), available from http://www.nytimes.com/2003/07/10/science/space/10CND-PLAN.html.. This is based on the original one which appeared in science (Steinn Sigurdsson et al., "A Young White Dwarf
ours is gone. Our solar system will become uninhabitable in about 4,500,000,000 years. Biological life as we know it could probably survive in the universe for another 100,000,000,000,000 years.334

So we have seen something of our tiny place in this really, really big universe with its countless planets, which existed for billions of years before humans arrived and will continue for trillions of years yet. Earth is a miniscule part of God’s creation.

What happens when we shift our focus to Earth itself, and the place of humans on it? Just as Earth is far from the centre of the universe, we discover that humans are far from being the central players on Earth. I begin by exploring that fact simply in terms of how long life on Earth has existed without us.

8.2 The story of Earth

8.2.1 The time scale of life on Earth

Our solar system made a relatively recent appearance in the universe, approximately 4.5 billion years ago (bya)335. Life on Earth appeared even more recently, about 3.85 bya. Muscled invertebrates appear in the fossil record about 550 million years ago (mya)336. The first vertebrates did not leave the oceans

---

334 Michelle Thaller, The End of the Universe in Two Poems (2002 [accessed 23 November 2004]), available from http://www.csmonitor.com/2002/0829/p25s02-stss.html. At this time, all suns will have run out of hydrogen to burn, and physical life as we know it will be impossible. The final collapse of all matter into black holes, which signals the end of physical life as we can even imagine it, will not occur for approximately $10^{100}$ years (Anonymous, Ultimate Fate of the Universe (2004 [accessed 4 October 2004]), available from http://www.brainyencyclopedia.com/encyclopedia/u/u/ultimate_fate_of_the_universe.html.)

until 320 mya, and mammals only became a significant force on the planet following the extinction of all dinosaurs except birds 65 mya\textsuperscript{337}.

The first hominids\textsuperscript{338} may have appeared about seven million years ago, and the first representatives of the genus *Homo* appeared perhaps 2.4 mya\textsuperscript{339}. Although the exact details of hominid evolution are controversial, the following figure from Richard Southwood appears to be fairly representative (figure 1)\textsuperscript{340}.

of expansions and contractions, so that the beginning of creation may be hundreds of billions, or trillions of years ago, or perhaps an infinite number of years ago. The orders of magnitude in the universe we know are staggering enough to suffice for this thesis.

\textsuperscript{337} Ibid, pp. 70-71.

\textsuperscript{340} Southwood, *The Story of Life*, p. 219.
Figure 1. One reconstruction of the human ancestral tree. For most of the span of what he think of as being ourselves, human beings, there were actually at least three species of humans, \textit{H. sapiens}; \textit{H. neanderthalensis} and \textit{H. erectus}. \textit{H. ergaster}, which may or may not overlap with \textit{H. sapiens}, is considered by some to be the first human.
Archaic *H. sapiens* appear in the fossil record about 400,000 years ago in Africa, Europe and Asia, and modern forms approximately 100,000 years ago. We modern humans coexisted with at least two other species of *Homo*: *H. neanderthalensis* and *H. erectus*, until at least 30,000 and 27,000 years ago respectively.

To Southwood’s figure, however, it appears that we need to add a new species, discovered in the last months of writing this thesis. A species of pygmy human has been discovered in Indonesia, and named *H. floresiensis*. It existed about 18,000 years ago, and is thought to have evolved from *H. erectus*. Its small size is thought to reflect the common trend towards dwarfism found in many island species, like the pygmy elephants *H. floresiensis* hunted. It appears then, that 30-50,000 years ago there were four hominid species in existence: *Homo sapiens, neanderthalensis, floresiensis* and possibly *erectus*. The human tree is a bush, pruned by contingency and perhaps *H. sapiens*.

*H. floresiensis* probably went extinct when a massive volcano erupted on their island. Neanderthals, on the other hand, apparently went extinct because of *H. sapiens*, even if not deliberately. One suggestion is that through interbreeding they became ‘subsumed’ into the *H. sapiens* gene pool, though recent research argues, admittedly inconclusively, against this. Other possibilities are that

---

341 Ibid, pp. 224-9. The Cro-Magnon people are an example of archaic *H. sapiens*. Our modern form is only slightly different. We are technically known as *Homo sapiens sapiens*, but in this thesis I shall simply refer to existing humans as *H. sapiens*. The modern form is only geologically "modern" - it still dates back 100,000 years!

344 Wong cites Trinkaus and Duarte (p. 31) and Wolpoff (p. 37) as supportive of this view in her review of the latest theories about Neanderthals (Kate Wong, "Who Were the Neanderthals?," *Scientific American* 13, no. 2 (2003).

345 David Serre et al., "No Evidence of Neandertal mtDNA Contribution to Early Modern Humans," *PLoS Biology* (*Public Library of Science Biology*) 2, no. 3 (2004). This research does not disprove human-Neanderthal interbreeding, but simply found no evidence that this had occurred frequently enough for Neanderthal mitochondrial DNA sequences to become established.
Neanderthals were actively driven to extinction or indirectly out competed. All three interactions may have happened in different places. In the Levant, which includes Israel, *H. sapiens* and *H. neanderthalensis* coexisted for about 60,000 years, whereas in Europe the latter disappeared within 10,000 years of the arrival of *H. sapiens*.

So modern *H. sapiens* has existed for only about four percent of the existence of the genus, *Homo*; less than two percent of the existence of hominids; 0.2 percent of the time since the great mammal explosion; and 0.002 percent of time since the origins of life on Earth. To represent this another way, if we marked significant events on a ruler, and used 1cm to represent all of *H. sapiens* existence; the genus *Homo* would occupy about 18cm (the width of this page); hominid evolution 60cm; the “age of mammals” 650 cm, and the beginning of life on Earth would be plotted 385 meters away! The life of the Christian church would occupy just one twentieth of one millimetre (about a tenth of a full-stop on this page).

Richard Dawkins attempts to convey the history of life on Earth as an arm span. If life begins at the left finger tip, then dinosaurs appear on the palm of the right hand, and go extinct at the last finger joint. Mammals then become the dominant terrestrial vertebrate, with the entire existence of *Homo* fitting in a nail clipping, and all recorded human history amounting to the dust of a single nail file stroke. Mayr represents the history of life as a calendar year, in which

346 Tattersall, "Once We Were Not Alone." Tattersall suggests the that advent of more advanced tools amongst *H. sapiens* led to the overwhelming of Neanderthals.

347 Ibid: p. 26. Others believe that the thousands of years of overlap in Europe is still plenty of time for interbreeding to cause the disappearance of Neanderthals, for example Wong, "Who Were the Neanderthals?"

348 Discrepancies between the two illustrations are due to rounding errors in the first example.

349 To include the beginning of the universe would require a line about 1.6km long.

mammals arrive on December 12th, Hominids at 10am New Year’s Eve, and H. sapiens at 11:56:30.\footnote{Mayr, Toward a New Philosophy of Biology: Observations of an Evolutionist, p. 69.}

Now that we have a glimpse of the time scale of life on Earth, it is time to consider the mechanisms by which life evolved and by which it continues to flourish today.

### 8.2.2 What is evolution?

The theory of the evolution of life on Earth as we have it today rests on the foundation laid by Charles Darwin. Darwin was not the first to offer a theory of the mechanisms of evolution, but his synthesis had an unparalleled impact on scientific thought about the evolution of species,

“No scientific revolution can match Darwin’s discovery in degree of upset to our previous comforts and certainties… [it] revolutionised our view of our own meaning and essence (insofar as science can address such questions at all) Who are we? How did we get here? How are we related to other creatures, and in what manner?”\footnote{Gould, “Introduction,” p. xi.}

Darwin’s theory was built on three universally accepted observations;

1. All organisms produce more offspring than can possibly survive.
2. All organisms within a species vary, one from the other

Darwin inferred from these facts his theory of natural selection. That is, of the many offspring produced in each generation, the few who survive long enough to breed will tend to be those who, by chance, are better adapted to the current local environment. In other words, the “natural” environment “selects” the best adapted, or “fittest” to be the breeders of the next generation. Survival of the fittest was a term Darwin adopted only reluctantly at the insistence of his friend
Alfred Wallace. Because of the misunderstandings this phrase frequently leads to, I shall continue to use Darwin’s original term, Natural Selection\textsuperscript{354}.

Darwin himself could only guess at the mechanism that lay behind the inheritance of variation. It was not until the 1920s that people realised the importance of the phenomenon of genetic mutation as an explanatory tool for Darwinian evolution. Eventually, evolutionists constructed the Modern, or Evolutionary, Synthesis from 1937-47. The Modern Synthesis used new knowledge about genetics to explain the mechanism for the variation in a population which was inherited by offspring (Darwin’s points 2 and 3 above), and brought widespread consensus\textsuperscript{355}.

Gould, Mayr and Dawkins, three significant figures in the discussion of evolution in scientific and popular circles\textsuperscript{356}, agree that the Modern Synthesis is correct as far as it goes. That is, \textit{genetic mutations lead to variable phenotypes amongst organisms, upon which natural selection acts}. They are all confident that this process has been validated to such an extent that it is no longer merely a theory, but may be designated as true and factual\textsuperscript{357}.

There are also sharp disagreements amongst them, which I shall explore now. I shall also introduce the theories of Lynn Margulis and Dorion Sagan, who have yet another way of looking at the evolutionary story. Margulis and Sagan, themselves Darwinists, disagree sharply with the Modern Synthesis, claiming that its proponents are zoocentric\textsuperscript{358}, and at least some of its concepts are “entirely

\textsuperscript{354} Richard Dawkins, \textit{The Extended Phenotype: The Gene as the Unit of Selection} (Oxford: W. H. Freeman and Company, 1982), pp. 179-80. Dawkins argues convincingly against using “survival of the fittest,” because of the confusion it causes. The primary objection for Dawkins is that “survival of the fittest” suggests that individual organisms are the primary units of selection. Secondly, “fit” has many meanings in the literature and is therefore misleadingly ambiguous.

\textsuperscript{356} Chris Daniels, email, 17 December 2003.

\textsuperscript{358} That is, focussed on animals, from insects to mammals, rather than acknowledging the importance of the microbial world.
wrongheaded,” obscuring more than they reveal. In order to compare and contrast the evolutionary stories from these four protagonists\textsuperscript{359}, I shall adopt the framework Gould proposed with which to categorise the currents of debate. As we shall see, Gould took great pains to ensure that his framework would be something that could be accepted by his opponents, even if they disagreed with the details of his own reconstruction.

Gould accepts that the Modern Synthesis was successful in fending off anti-Darwinist explanations for the origins of the life we see around us. He contends, however, that the Modern Synthesis was initially generous of spirit and somewhat pluralistic in form, before later becoming calcified into a restricted version\textsuperscript{360}. This restricted version required an exclusive commitment to adaptationism, and natural selection as a virtually exclusive mechanism for evolution\textsuperscript{361}. For example, he claims that in 1963 Mayr characterised the Modern Synthesis thus,

“…all evolution is due to the accumulation of small genetic changes, guided by natural selection… transspecific evolution is nothing but an extrapolation and magnification of the events that take place within populations and species (emphasis mine).\textsuperscript{362}.”

Gould believes that from the seventies onwards there was a resurgent antithesis to the Modern Synthesis, which is still being worked through. This new understanding, he says, retains its basis in Darwinism, but builds upon and expands the original theory by removing its 19\textsuperscript{th} century philosophical and metatheoretical commitments\textsuperscript{363}. According to Gould, the antithesis proves that, “If Mayr’s characterization of the [Modern Synthesis] is accurate, then that theory, as a general proposition, is effectively dead, despite its persistence as textbook orthodoxy.\textsuperscript{364}.” What remained for Gould was to show the limitations of

\textsuperscript{359} I count Margulis and Sagan as one protagonist. The sections of the book which are of interest in my thesis, are almost entirely derived from the work of Margulis over many years.

\textsuperscript{360} Gould, \textit{The Structure of Evolutionary Theory}, p. 23.

\textsuperscript{361} Ibid, pp. 46, 70.

\textsuperscript{362} Ibid, p. 1003. He does not include the full reference, which is to page 586 of Mayr’s 1963 classic (Ernst Mayr, \textit{Animal Species and Evolution} (Cambridge: Harvard University Press, 1963).)

\textsuperscript{363} Gould, \textit{The Structure of Evolutionary Theory}, p. 23.

the Modern Synthesis, and to argue for the inclusion of the post seventies antithesis.

This confronts Gould with a dilemma - how can he convince those Darwinians who accept the Modern Synthesis, that his synthesis is recognisably Darwinian\textsuperscript{365}? His first step is to define Darwinism in terms,

“…specific enough to win shared agreement and understanding among readers, but broad enough to avoid the doctrinal quarrels about membership and allegiance that always seem to arise when we define intellectual commitments as pledges of fealty to lists of dogmata.\textsuperscript{366}"

To do this he needs to reach consensus with his opponents about the amount of dissent one can express whilst still being accepted as a Darwinist. Not only historical continuity with the ideas of Darwinism, but also shared commitment to their meaning today is required for scientists to be able to say that they are part of the one intellectual movement.\textsuperscript{367} He therefore seeks a,

“…minimal list of the few defining attributes of the theory’s central logic… [without] which the theory would either collapse into fallacy or operate so differently that the mechanism would have to be granted another name. (emphasis his)\textsuperscript{368}"

Gould concludes that there are three principles which encapsulate the Darwinian paradigm. Rejection of any of these three makes one a non-Darwinist. To convey this, since primates process complex thoughts best as pictures\textsuperscript{369}, he uses the image of a three legged stool. As his entire book seeks to demonstrate, these three principles are those around which there has been the greatest controversy, and in which there are still conceptual weaknesses. Expressing the three principles in the

\textsuperscript{365} In this, his concern somewhat parallels one of the tasks of this thesis: to demonstrate that a Christian community which integrates a new worldview remains Christian, even if it opens up possibilities which many Christians will not accept.

\textsuperscript{367} Ibid, p. 10.

\textsuperscript{368} Ibid.

\textsuperscript{369} Ibid, p. 15.
language of Darwin, and as insisted upon in the calcified Modern Synthesis, Gould says that they concern;

**AGENCY** - *Individuals are the agents of evolution*. Darwin argued that the apparent order of creation, traditionally claimed to be evidence for a benevolent and powerful designer, was actually a side effect of the struggle of *organisms* to survive. It was not God, but *individuals*, and their struggle to survive which was the driving force for creation as we see it.

**EFFICACY** - *Natural Selection can explain all that we now see*. Many people accepted Darwin’s claim that natural selection was a reality. His opponents rejected Darwin’s claim that this alone could account for all the variation in nature. Darwin insisted that natural selection was sufficient.

**SCOPE** - *Selection upon individuals explains all of evolution*. Even Darwin’s supporters struggled to see how his theory could explain macroevolution (evolution at levels above species). Darwin believed that the immensity of geological time meant that evolution on the small scale could eventually account for all evolution, stating that apparent gaps between species and higher taxa in the fossil record were due to the relative rarity of fossilisation.

Gould argues that such a limited view of Darwinism can no longer be accepted, hence his book, which,

“… attempts to expand and alter the premises of Darwinism, in order to build an enlarged and distinctive evolutionary theory that, while remaining within the tradition, and under the logic, of Darwinian argument, can also explain a wide range of macroevolutionary phenomena lying outside the explanatory power of extrapolated modes and mechanisms of microevolution, and that would therefore be assigned to contingent explanation if these microevolutionary principles

---

370 Darwin allowed that the term, “struggle” was usually metaphorical. Whilst rams may struggle for mates in combat, plants, for example, simply either survived or did not without any conscious struggle.

necessarily build the complete corpus of general theory in principle.\textsuperscript{372}

Gould then attempts to expand his version of the Modern Synthesis within each of these three categories. I shall now consider to what extent his attempts have been accepted by Mayr, Dawkins, and Margulis & Sagan.

AGENCY- Gould argues that the Modern Synthesis’s fundamentalism with respect to the organism as the agent of selection cannot stand in the light of new evidence. Gould claims that we must recognise a hierarchy of selection operating on genes, cell lineages, organisms, demes, species and clades\textsuperscript{373}. Mayr partially agrees, mentioning that genes, individuals, species and populations are significant entities in evolution. Whilst he says that it is the changes in populations which characterise evolution, he argues that individuals are the agents on which selection acts\textsuperscript{374}, and rejects most forms of group selection\textsuperscript{375}. Dawkins’ thought on the matter is a little more difficult to characterise. It is clear that he preferences the gene\textsuperscript{376} as the fundamental unit of selection, as he argues most extensively in the revealingly titled, \textit{The Extended Phenotype: The Gene as the Unit of Selection}\textsuperscript{377}. Gould appreciates that Dawkins’ work has undermined the neo-Darwinist obsession with the individual as the only unit of selection, but castigates Dawkins for replacing one level of reductionism with another\textsuperscript{378}. Gould claims that Dawkins supports his extended hierarchy of selection though he grasps it,

\textsuperscript{372} Ibid, p. 1339. Perhaps he can be forgiven for having such a long summarising sentence, given that the book is 1,300 pages!

\textsuperscript{373} Ibid, p. 21, 62.

\textsuperscript{374} Mayr, \textit{What Evolution Is}, pp. 140-42. He has held this position since the 1950s (Mayr, \textit{Toward a New Philosophy of Biology: Observations of an Evolutionist}, p. 101.)

\textsuperscript{375} Mayr, \textit{Toward a New Philosophy of Biology: Observations of an Evolutionist}, pp. 119-23.

\textsuperscript{376} It is actually a lot more complicated than that, since in some cases sections of DNA larger than single genes may be thought of as being inherited as units, and sometimes pieces smaller. The details are irrelevant to this thesis, but receive extended consideration in Dawkins, \textit{The Extended Phenotype}, pp. 85ff. Dawkins acknowledges another unit of evolution, the meme, which is a unit of cultural transmission such as a song, fashion, or architectural development. These replicators, however, are not mechanisms of biological evolution- they are derivatives of it, and so will not be considered further. His seminal thinking in this area is found in Dawkins, \textit{The Extended Phenotype}, chapter 11.

\textsuperscript{377} Dawkins, \textit{The Extended Phenotype}.

\textsuperscript{378} Gould, \textit{The Structure of Evolutionary Theory}, p. 72.
“through a glass, darkly,” and implies that Dawkins’ ongoing defence of gene-
level selectionism is more about recalcitrance than evidence\textsuperscript{379}. His main
evidence for this comes from a chapter in Dawkins’ work, *Climbing Mount
Improbable*, in which he mentions the possibility of natural selection choosing
amongst large groupings\textsuperscript{380}. Gould’s review of *Climbing* is scathing, except for
two chapters in which he finds reason to, somewhat patronisingly, welcome
Dawkins into his club,

“The last paragraph of this chapter [Kaleidoscopic Embryos]
reiterates these themes in a manner almost suggestive of a
personal epiphany. As a former anathamee, I can only cheer
from the sidelines and say "bravo and welcome."\textsuperscript{381}"

Gould then laments that subsequent paragraph’s return to Dawkins’ “worn-out
and illogical ‘selfish gene’ theory.”\textsuperscript{382} Gould’s claim that Dawkins unwittingly
agrees with him is overstated. Certainly, Dawkins is unconvinced. The year after
Gould’s review, Dawkins released *Unweaving the Rainbow*, in which he observed
that,

“… Gould is one of the few Darwinians who still think of
natural selection as working at levels higher than the individual
organism.”\textsuperscript{383}"

This is probably true, but many are not convinced by Dawkins either, and
continue to argue that the individual is the main unit of selection\textsuperscript{384}. Mark Ridley
demonstrates convincingly, however, that whilst the action of individuals is
clearly important for their survival, it is their very perishability which precludes

\textsuperscript{379} Ibid.

\textsuperscript{382} Ibid.

\textsuperscript{383} Dawkins, *Unweaving the Rainbow*, p. 199.

\textsuperscript{384} Mark Ridley, *Evolution* (2nd) (Reproduced from *Evolution*, Chapter 12, "The Units of
them as the units of selection. He shows that whilst the behaviour of individual organisms, for example, may be involved in selection, it is essential that this behaviour have a genetic basis if it is to be inherited, and therefore evolvable. Genes therefore, not organisms, or any higher level for that matter, have priority as units of selection.

Mayr disagrees with Ridley, and therefore Dawkins. He believes that the very concept of the unit of selection is confusing. He argues that no gene can be selected in isolation, since some will be deleterious in some whole genotypes, and advantageous in others. He believes that whilst evolution leads to the change in frequency of genes in a population, only gene-composites (i.e. individuals) can be targeted by selection. Here Mayr distinguishes the unit of selection (which he is happy to admit may be the gene), from the target of selection, i.e. that which natural selection actually works on and selects amongst, which is the individual. He believes that the confusion of the units and targets of selection is the basis of the genic selectionists. Dawkins believes that such distinctions miss the point, since he agrees that genes are not selected in isolation, but rather for their capacity to cooperate. The difference seems to be that Mayr assumes that individual animals are the true gene-composites, whereas Dawkins convincingly argues that this is not the case, for gene interactions transcend the individual host organism. This is his extended phenotype concept. Dawkins’ claim that his ideas are compatible with Mayr’s seems persuasive, as does his claim that his views are a better way of expressing what they both agree with. Since the argument from Mayr, above, was written only last year, he clearly disagrees, though perhaps there is some convergence, as he uses the extended

385 Ibid.
386 Ibid.
389 Dawkins, *The Extended Phenotype*, p. 239.
390 Ibid.
phenotype concept in his latest work, though without explicitly affirming all that Dawkins claims for it.\(^{391}\)

Margulis and Sagan disagree with Gould, Mayr and Dawkins. They accept only one unit of selection (against Gould), but locate it between Mayr’s organism and Dawkins’ gene. For them, it is the *cell* which drives evolution,

> “DNA… stores evolutionary information but does not create it. Selfish genes… may be taken as figments of an overactive, primarily English speaking imagination. *The living cell is the true self… The engine of evolution is driven by tiny selves of which we are only half conscious…* The bacteria… The actions of the bacteria and other subvisible selves perpetuate old and generate new species (emphasis mine).\(^{392}\),

Margulis and Sagan attack the very notion of an organism as understood by most biologists, who are preoccupied with large animals and plants. They argue that what most zoologists would consider to be individuals (e.g., a cow, or a human) are actually assemblages of symbiotic relationships. The mammalian part of a cow, for example, is intimately connected with the microbial gut fauna which digest cellulose in its gut.\(^{393}\) The many microbes and minute invertebrates that live symbiotically with the mammalian part of *H. sapiens*, from eye mites to gut bacteria, comprise about *ten percent* of our dry body weight.\(^{394}\) Even more symbiotically integrated are the 250 bacterial genes which have become incorporated directly into our DNA.\(^{395}\) It is ironic that Margulis and Sagan are so critical of Dawkins, to whom they allude in the above quote. He accepts this aspect of their work, and wants to take it further.\(^{396}\) It does seem that main focus fits well with his hypothesis of the extended phenotype, especially their

\(^{394}\) Ibid, p. 18.

\(^{395}\) Ibid, p. 76.

symbiogenesis hypothesis. This hypothesis directly challenges Gould’s second category, that of efficacy, and I will return to it shortly.

EFFICACY-
Gould reinvigorates orthogenesis as a challenge to Darwin’s claims of the total efficacy of natural selection. As he says, “Most textbook one-liners have dismissed orthogenesis as a theistic remnant operating as a mild pollutant within science.” Mayr, for example, dismisses orthogenesis as something based on cosmic teleology, or finalism, which has been, “thoroughly refuted.” Gould, however, demonstrates that most proponents of orthogenesis were determinedly non-theistic. Orthogenesis was primarily the theory that the full range of possible variation in a generation is not available to natural selection to operate on. Rather, variation is constrained to certain channels or directions. Advocates of orthogenesis were wrong, Gould argues, because claiming that the channels were unidirectional, and tried to replace natural selection with orthogenesis, rather than accepting that both processes play a role in evolution.

So Gould’s limited, non-theistic orthogenesis is simply the presence of, “structural, historical and developmental constraint in channelling pathways of evolution, often in highly positive ways.” Mayr accepts that this happens, and lists a number of such constraints, though he does not use the term orthogenesis. Chance is also a major factor according to Mayr, which does not so much channel natural selection as cut across it,
“Because evolution can only tinker, it cannot produce the best possible of all designs... it is often stuck making the best of a bad situation.”

Organisms which survive and reproduce do not have to be the best of all possible combinations of genes, but simply a better combination than others. Both Dawkins and Mayr provide lists of the various constraints which prevent natural selection from developing perfect organisms. Mayr distinguishes natural selection from sexual selection, which is the ability to attract mates. He shows that natural and sexual selection at times select in different directions, such as the evolution of the striking colour of many male birds, which attracts females, but also predators, thus increasing reproduction at the likely expense of survival.

He also explains that the more pliable an organism’s phenotype is, the less effectively natural selection can work on its genotype. Plants are the most striking example of pliable phenotypes; genetic clones will grow very differently depending on the soil and climate in which they are placed.

Dawkins addresses the constraints on natural selection in the same speculative chapter which Gould seized upon above, as evidence that Dawkins was beginning to agree with him. In admitting the possibility of the sort of limited orthogenesis which Gould proposes, Dawkins is clear that what he means by apparent selection of larger groupings is only somewhat analogous to Darwinian selection. It does not appear in any way to contradict, or require the sort of reworking of Dawkins’ theories that Gould calls for. Dawkins notes that Gould emphasises with approval the pluralistic character of Darwin’s own thought about the mechanisms

---

405 Dawkins, *The Extended Phenotype*, p. 45.

406 Ibid, pp. 30-54.

of evolution. He contends, however, that Darwin’s pluralism was due to criticisms from his peers which have subsequently been shown to be false.\footnote{Dawkins, \textit{The Extended Phenotype}, p. 19.} Dawkins freely admits that evolution occurs by mechanisms such as neutral mutation and genetic drift, but differentiates \textit{evolution}, which may mean neutral change, from \textit{adaptation}, which requires natural selection on phenotypes.\footnote{Ibid.} Adaptation is, to him, the overwhelmingly most significant and interesting form of evolution.

Dawkins points out that what is best in one generation will not be best in the next if the environment has changed. If we remember that the environment includes all other life forms as well as the abiotic surrounds, then the environment inevitably \textit{will} be different in each generation. There is thus a time lag in natural selection. The faster the environment changes, the less well adapted the next generation will be.

There are also historical constraints which limit adaptation. The more specialised body plans become, the less they can be subsequently modified. Natural selection must choose from what is available at the time, to meet the current environmental challenges. For example, our front feet eventually evolved into hands, but no vertebrate has six feet.

There are limited resources for any one body. An animal cannot both sprint to evade predators and be heavily armoured against them. Time spent feeding limits time available for breeding. Camouflage requires the animal to stay fairly still, which may limit both its feeding and breeding.

All organisms could not be perfect anyway. If a perfect predator chases a perfect prey, what would happen? If two organisms perfectly compete for a shared resource, then what? Since the death of some organisms is essential for the life of others, a world in which all organisms perfectly escape death is impossible. Dawkins devotes a chapter of one of his works to explain how mimicry and
camouflage is an effective strategy for organisms even if only partially effective, because the organism being tricked has only imperfect vision, and other things to occupy its limited brain\textsuperscript{414}.

As organisms become more complicated, and their behaviour is driven by conscious decisions as well as instinct, it becomes inevitable that they will make mistakes, especially as their environment is in many ways malevolent. Since organisms live in a dynamic web of other organisms which attempt (consciously or not) to manipulate or destroy them, it is impossible to be perfectly adapted. This is clearer if we look at the level of genes, and their chances of surviving into the next generation. An organism’s genotype remains constant for its life, but its environment changes daily, even minute to minute. Successful genes, then, are often those that code for flexible, and therefore imperfect, strategies in their hosts.

Margulis and Sagan believe that the processes discussed above are only minor components of evolution. They propose that symbiogenesis is the major driving force at every stage of the evolutionary story from the origin of life to the present. Symbiogenesis is the process whereby a symbiotic relationship eventually gives rise to the fusion of two organisms into one, or more strictly, two genomes into one. For example, it was Margulis who demonstrated that the mitochondria in all plant and animal cells were initially free living organisms\textsuperscript{415}. She proposed that chloroplasts were incorporated into plant cells in the same way\textsuperscript{416}. Margulis and Sagan’s thesis can be summarised in these quotes,

“… let us now explain how new species come into being… Random DNA mutations, primarily destructive in their effects, account only for the beginnings. The role of randomness has

\textsuperscript{416} Margulis, \textit{Origin of Eukaryotic Cells}, pp. 276-93.
been exaggerated in the evolutionary saga... Live beings by contrast are the protagonists (emphasis mine).\textsuperscript{417}

“The agents of evolutionary change tend to be fully alive organisms, microbes, and their ecological relations, not just the random mutations these microbes have inside them... The unseen beings that decimate our populations with virulent disease and provide soil nitrogen to our food plants play the major creative role in the genesis of new species.\textsuperscript{418}

“...this Darwinian claim to explain all of evolution is a popular half-truth whose lack of explicative power is compensated for only by the religious ferocity of its rhetoric. Although random mutations influenced the course of evolution, their influence was mainly by loss, alteration and refinement... Mutations, in summary, tend to induce sickness, death or deficiencies.\textsuperscript{419}

According to Margulis and Sagan, every step in the evolution of life up to the eukaryotic cell is the result of symbiotic fusion. Each of the major evolutionary transitions in cell type, from archaebacterium, through the protozoans and on to plant and animal cells, arose through the integration of new genomes into existing cells. They claim that the importance of symbiogenesis for animals is not limited to the formation of the eukaryotic cell, since even larger animals like cows and humans are themselves not strictly individual organisms, but composites of many different individuals.

How have their ideas been received? The symbiogenetic origins of chloroplasts and mitochondria are universally accepted by advocates of the Modern Synthesis\textsuperscript{420}, and most accept the formation of eukaryotic cells from a symbiogenesis of an archaebacterium with some eubacteria\textsuperscript{421}. Mayr is not alone

\textsuperscript{417} Margulis and Sagan, \textit{Acquiring Genomes}, pp. xv, xvi. In her earlier work Margulis was more affirming of the importance of genetic mutation and natural selection (Margulis, \textit{Origin of Eukaryotic Cells}, pp. 51, 48-52 respectively.) Whether this shift from 1970 to 2003 is the result of a change in her opinions, or a perceived need to make more extreme statements to engage those who continue to minimise the role of symbiogenesis is unclear.

\textsuperscript{418} Margulis and Sagan, \textit{Acquiring Genomes}, p. 39.

\textsuperscript{419} Ibid, p. 29.

\textsuperscript{420} Mayr, "Foreword," p. xii.. Dawkins is a little more cautious about the chloroplast hypothesis, which he calls “pretty uncontroversial” and “widely agreed.” (Dawkins, \textit{Unweaving the Rainbow}, pp. 225-28.) This may simply reflect that he is writing five years earlier than Mayr.

in claiming that the symbiogenic formation of the eukaryote is, “arguably the most important event in the whole history of life on Earth.” He accepts that symbiosis is not given nearly enough weight in discussions about evolution, yet he devotes only two thirds of a page to the concept in his latest book, What Evolution Is.

More attention is devoted to the topic in Carl Zimmer, although he focuses on the slightly different reconstruction by Carl Woese. Zimmer acknowledges that symbiogenesis was not taken seriously until the early sixties, and so excluded from the Modern Synthesis. Nevertheless, he claims that symbiogenesis, “still follows Darwin’s basic rules.” This is true only because Darwin was ignorant of genetics in the first place. There is nothing in the Modern Synthesis (as Zimmer admits), which predicts a process like symbiogenesis. It is true that once symbiogenesis has occurred, the resulting organism will be acted upon by Darwinian processes. So symbiogenesis is not, (contra Margulis & Sagan) an alternative to natural selection, but only to random mutation, and so it expands rather than overthrows the Modern Synthesis.

Margulis’ obsession with cells leads her to speculate that Earth itself is one enormous cell. She was an early collaborator with James Lovelock in the work on the Gaia hypothesis. Their early presentation of the thesis was emphatically rejected by evolutionists. Dawkins criticised the apparent assumption that the ecology of Earth was benign, guided by an overarching cooperative principle,

422 Mayr, What Evolution Is, pp. 48-49.
423 Ibid, pp. 233-34.
424 Zimmer, Evolution, pp. 107-15. The differences seem to relate mostly to the number of kingdoms of life, five for Margulis & Sagan, and three for Woese. The differences are explored in Margulis and Sagan, Acquiring Genomes, p. 154. The details, however, are not important here.
425 Zimmer, Evolution, pp. 112-14. He talks about “symbiotic theory,” but is clearly referring to the same process which Margulis & Sagan call symbiogenesis. Margulis and Sagan document that symbiogenesis was taken more seriously in Russian, French and German speaking institutions as far back as the 1860s (Margulis and Sagan, Acquiring Genomes, p. 97.).
even consciousness. Dawkins picks on the language Lovelock used to explain the proportions of various gases in the atmosphere, which result from the fact that, “… the biosphere actively maintains and controls the composition of the air around us, so as to provide an optimum environment for terrestrial life.” Dawkins demonstrated that the idea of a homeostatically adapted Earth fails either because of its reliance on group selection, or the necessity for a universe of competing, breeding planets amongst which natural selection would “choose” the best survivor.

To use some examples not mentioned by Dawkins, Lovelock says that the diatom lifecycle is a, “… conveyor belt constructed by Gaia.” Similarly, the creatures who inhabit brine pools do so only because they have been given permission by the rest of the living world. To my mind, however, Lovelock’s claims look more like a byproduct of loose language rather than factual assertions. Loose language is widespread in scientific writing, for example the oft repeated claim that some property of an organism has evolved for some purpose or other. Dawkins himself devotes a book to the exploration of good scientific poetry, in which he acknowledges that the “selfish gene” is just a metaphor, which can lead people awry if they misunderstand personification. All Dawkins has done is disprove a sentient, cooperative, version of Gaia, one which is only implicit in the text. For example, Lovelock clearly did not mean that plants produce oxygen for other life (Dawkins’ first example), in the light of his other explanations of the polluting effects of oxygen to which other components of the ecosystem needed to adapt if they were to survive.

---

430 Now almost completely rejected, see Mayr, *Toward a New Philosophy of Biology: Observations of an Evolutionist*, p. 79.)

433 Ibid, p. 89.

Lovelock accepted Dawkins’ criticism as evidence that the hypothesis had been poorly stated and thought through, but only in some aspects which were not central to his main point\textsuperscript{436}. In his preface to the revised edition of \textit{Gaia}, Lovelock maintains that, although he did poorly present some ideas in the original work, he also made clear that his attributing sentience or purpose to Gaia should not be taken literally\textsuperscript{437}. Recent presentations have emphasised that the Gaia hypothesis is not a teleological mechanism, as evidenced by the use of the completely mechanistic “Daisyworld” model to explain climate regulation by living organisms\textsuperscript{438}. The central claim of the Gain hypothesis has always been that evolutionists traditionally underemphasise the coevolution of living organisms and their non living environment\textsuperscript{439}. Most importantly, life (the biota) regulates the temperature and composition of Earth’s surface, so that the \textit{abiotic} environment evolves with and in response to the biotic environment. This implies that the evolution of life is not constrained only by “the environment”, but by the rate at which it is able to induce changes in the environment.

For example (mine, not theirs), the evolution and spread of aerobic organisms was constrained by the need to wait until the photosynthesis organisms had sufficiently modified the Earth’s atmosphere. This is not to say that organisms, or genes, “waited”, but that when viewed from a whole Earth perspective, the spread of aerobes around the globe had to wait. Gould does not appear to be aware of the clarified hypothesis, since he still rejected it on Dawkins’ grounds only a few years ago\textsuperscript{440}. Mayr reports that few evolutionists accept it\textsuperscript{441}, because as he

\textsuperscript{436} Lovelock, \textit{The Ages of Gaia : A Biography of Our Living Earth}, pp. 32-34.

\textsuperscript{440} Gould, \textit{Self-Help for a Hedgehog Stuck on a Molehill}.

\textsuperscript{441} Mayr, \textit{What Evolution Is}, p. 45. In a questions and answers section at the back of the book, he states that the Gaia hypothesis
presents it, the theory involves an inherent program. Even then he admits the theory is not incompatible with Darwinian evolution\textsuperscript{442}, but he does seem to be referring to the earlier, more teleological presentation of the hypothesis which Lovelock himself rejects. Mayr certainly accepts abiotic-biotic interaction and coevolution.

It appears, then, that all of the authors I am considering reject any idea that the whole Earth system is built through any kind of global consciousness or teleological cooperative effort. They accept, however, that there is an intimate link between biotic and abiotic systems, and that the lag between new biological innovations and their full expression in the abiotic environment may constrain the pace of evolutionary change. Where Gould deals with the question of time scales specifically is in the third aspect of his framework; the notion of scope. This encapsulates his claim that different evolutionary mechanisms operate at different time scales.

SCOPE- A key example of this phenomenon, for Gould, is punctuated equilibrium, a concept which he helped develop and is famous for championing. Mayr agrees that punctuated equilibrium is compatible with Darwinism. He goes further, however, arguing that it is compatible with \textit{gradual} Darwinian evolution and that there is “no conflict whatsoever” between punctuated equilibrium and the original Modern Synthesis\textsuperscript{443}. He believes that Darwin was correct in claiming that the fossil record is incomplete, and misleadingly gives the appearance of saltations\textsuperscript{444}.

Gould believes just the opposite. He works from the assumption that the fossil record is a reliable indication of the way a species have changed over time, and that punctuated equilibrium and mass extinction events, \textit{rather than} gradual evolution are the best explanations of the fossil record as we have it. For Gould, gradual, or micro, evolution occurs only at the lowest tier, and cannot simply be

\textsuperscript{442} Ibid, p. 307.

\textsuperscript{443} Ibid, p. 298.

scaled up to account for changes at other tiers. Certainly, at the very least, Mayr seems to underplay the role of mass extinction events, which led to profound shifts in the composition of species and populations.

Dawkins criticises Gould for lumping very different types of non-gradual evolution together. He agrees with Mayr that punctuated equilibrium is simply gradual Darwinian natural selection operating at a faster than usual pace, over perhaps tens of thousands rather than millions of years. Dawkins admits that individual macromutations may occur (large changes in phenotype caused by a single mutation, rather than many progressive small ones), but only very rarely, rendering them practically insignificant as mechanisms of evolution. He refutes the claim that punctuated equilibrium is a unique aspect of evolution at some length, before concluding that, “When you spell out the Gouldian rhetoric into real-life practicalities, it stands revealed as the purest of bad poetic science.”

Dawkins and Gould do agree on the aspect which Mayr appears to underplay, the role of catastrophes in dictating the forms of life we see today. Rather than try to include catastrophism as part of a continuum of time-scaled phenomena, Dawkins simply says that catastrophes are non-Darwinian phenomena, after which natural selection restarts on the survivors.

Overall, Gould’s framework has been a useful one within which to debate evolutionary processes. It succeeded in including the work of evolutionists like Margulis, whose work Gould did not consider and with whom he would have

446 Dawkins, *Unweaving the Rainbow*, p. 197.
significant differences. It also included Mayr, with whom Gould has some
disagreement, and Dawkins, with whom he has much more. As we will see later,
it can even include versions of theistic evolution, though Gould personally rejects
all of them. But does the inclusion of symbiogenesis and catastrophism, and to
a lesser extent orthogenesis, really create a new world view which, as Gould
claims, “…must be construed as basically different from the canonical theory of
natural selection, rather than simply extended (emphasis mine). Mayr and
Dawkins respond with an emphatic, “No.”

Mayr argues that his characterisation of the Modern Synthesis, which Gould said
was effectively dead, was misunderstood by Gould. What Mayr was actually
describing was a very reductionist interpretation of the Modern Synthesis.
Mayr thus agrees with Gould’s final framework, but disagrees that the Modern
Synthesis as a whole was ever as canonically narrow as Gould maintains. He
accepts that there was a brief overemphasis on natural selection, to finally bring
an end to Lamarckism, but that this rapidly gave way to an exploration of the
stochastic processes and constraints that Gould went on to emphasise.
Nevertheless, he admits that the initial synthesis was an “extreme simplification,”
because individuals frequently forgot the pluralism of evolutionary
mechanisms. Quickly, however, in his view, a more realistic theory was
fleshed out, which revised the original Darwinian theory in at least thirteen
ways. These changes, he claims, were reformulations rather than substantive
changes. Mayr believes that the supposedly novel theories Gould introduces,
where they are correct, may be, “basically different from the canonical theory of
natural selection,” but that the canonical theory was never limited to natural

452 Ibid, p. 3.
453 Page 42.
455 Ibid, pp. 534-35.
457 Ibid, pp. 540-42.
selection in the first place. Gould is therefore, in Mayr’s view, attacking a phantom. He concludes,

“Neither the discovery of numerous new facts relating to evolution nor the development of new concepts of speciation and genetic variation have required any essential revision of the picture of evolution as developed during the evolutionary synthesis. I emphatically deny the claims of various authors that these recent developments have led to an end of Darwinism, or of neo-Darwinism, or of the evolutionary synthesis. They are simply a filling in of missing pieces…”

Dawkins believes that his promotion of gene-level selection and the extended phenotype fits firmly within the logic of Darwinism and the Modern Synthesis. He is sceptical, and characteristically blunt, about Gould’s claims to offer a revolutionary new view,

“[Gould’s] quixotic strawmanering, his shameless windmill-tilting, seem almost designed to encourage misunderstanding... Readers regularly gain the impression that he is saying something far more radical and surprising than he actually is.

Francis Steen, in his review of the ongoing clashes between Gould and his many critics including Dawkins, concludes that there is not much of substance in the debate, in which there is a tendency, especially on the part of Gould, to, “magnify every straw into a forest of spears.” Dawkins himself admits that there are many important points on which he and Gould agree.

So although Gould has not convinced his peers that he has created something fundamentally different, the framework in which he set the debate has provided a way of comparing and contrasting different views about what evolution is and how it operates:

---

460 Ibid, p. 191.
463 Dawkins, Response to Brown.
AGENCY- All agreed that individual organisms are not the (only) units of selection, but none respond favourably to the higher levels proposed by Gould. Dawkins promotes an almost exclusive focus on genes. Margulis and Sagan favour cells, though I believe that Dawkins is correct when he argues that their view is a special case of his extended phenotype proposal. Mayr accepts a notion of the extended phenotype, and that genes are the units of selection, but still claims that individuals are the agents of selection.

Without being able to prove Dawkins’ world view correct, it does seem to make the more persuasive case, that the unit of selection is that which persists, and is replicated, i.e. the gene rather than the body it is contained within. He also makes a strong case that the agents on which selection act are not limited to the bodies, or vehicles, in which those genes travel, but to the whole extended phenotype which the genes affect.

EFFICACY- Diversity amongst genes and the extended phenotypes they generate arises from random mutations in the genes themselves, and symbiogenesis amongst the bodies which genes occupy. As these bodies become more complicated, further mutations may be negatively constrained. Existing body plans may also enhance other directions of mutation. The resulting phenotypic variety affects how likely it is that the genes and gene-groups which express them will be replicated. This process of natural selection drives evolution, limited by numerous constraints and chance events. At a whole of planet (Gaia) level, the time lag between biotic evolution and abiotic response may slow the process at key points.

SCOPE- Gould fails to convince his contemporaries that punctuated equilibrium is a fundamentally different phenomenon than that already accepted in the Modern Synthesis. Mayr and Dawkins accept that evolutionary processes go through acceleration and stasis, but believe that the mechanism is still natural selection of micro mutations and symbiogenesis. The phenomenon of catastrophic events, even global catastrophes, is accepted by all and is now textbook orthodoxy. Gould sees it as part of a temporal continuum, Mayr and
Dawkins see it as a non-Darwinian event after which Darwinian processes resume.

So, at a small time scale, random mutation usually produces gradual changes, supplemented with symbiogenetic fusions. When viewed from a larger time scale, evolutionary progression is less smooth, with periods of stasis interspersed with geologically rapid changes. At its most extreme, cataclysms such as massive asteroid strikes and widespread volcanic activity may change the environment so rapidly that almost all life is extinguished, after which body forms may be able to radiate into the numerous empty niches. Life as we see it is the result of an interplay between gradual processes and global traumas.

8.2.3 Does God guide evolution?

So we now have at least a rough sketch of the mechanisms of evolution, the scale over which they work, and what it is that they work on. One mechanism only briefly mentioned was the possibility of divine activity. Has and does God influence the course of evolution? Is there, alongside the very limited, mechanistic orthogenesis which the above authors accepted, a theistic orthogenesis, in which God guides life to a desired end state? Such orthogenesis would be forward looking, or teleological, in distinction from natural selection and mechanistic orthogenesis. Do the evolutionists considered above see any evidence of forward looking orthogenesis?

In this discussion, I will be considering only the possibility that God guides evolution, not theological alternatives to evolution, such as the creationist theories. Creationists do not fit into Gould’s framework, since they reject the common ancestry of all organisms and, in the case of young earth creationists, almost every other Darwinian assumption. I agree with Mayr that the claims of creationists have been thoroughly refuted, as do all the other scientists.

---

464 The newest advocates of forward looking, or prescient orthogenesis do not necessarily argue that God is the mechanism, but simply “an intelligence” (Zimmer, *Evolution*, p. 325.) This appears to be more a politically motivated attempt at hair splitting than a real attempt to say that there is an intelligent designer in the universe who is not God.

mentioned above. I do not, therefore, consider it fruitful to revisit creationism in this thesis.\textsuperscript{466}

I am also simply assuming the existence of God. The scientists I have surveyed above do not agree as to whether this is likely. Indeed, they cover the full spectrum of belief, from an apparently positive assessment in Zimmer\textsuperscript{467}, through the back-handed agnosticism of Margulis and Sagan\textsuperscript{468}, to the atheist leanings of Gould\textsuperscript{469}, and the absolute atheism of Dawkins\textsuperscript{470}. What they agree upon is that, even if science cannot dis/prove the existence of God, it can tell us a great deal about how God relates to life on Earth, or perhaps more pointedly how God does not relate to life.

Despite his personal atheism, Gould accepts that Darwin’s concepts of agency and efficacy can legitimately be modified to argue that a higher force “employs” natural selection as its mechanical agent. He also states, however, that he is talking hypothetically, for, “no such defensible scientific hypothesis now exists.”\textsuperscript{471} He is convinced that we see contingency, not divine will, in the story of life. Our mammalian ancestors are not the result of planning or guidance, but one of numerous possible alternatives\textsuperscript{472}. If this is true of the mammals, then it must be true of us, so that,

\textsuperscript{466} On becoming a Christian the year after completing my B. Sc. (Hons) in zoology and genetics, I was a creationist for several months. I even had discussions with the Creation Science Foundation about doing a PhD on possible links between fossil-record giantism and changing $O_2$ levels. To help me decide whether to, I spent weeks of my summer holidays (!) in the Adelaide University library looking up all of the references to scientific articles I was reading in creation science literature. I concluded that the authors I was reading were either consistently incompetent or dishonest in their use of the material they cited. My first year of study at theological college removed the last vestiges of a theological need to defend biblical literalism.

\textsuperscript{468} Margulis and Sagan, \textit{Acquiring Genomes}, p. 26.

\textsuperscript{471} Gould, \textit{The Structure of Evolutionary Theory}, p. 21.

\textsuperscript{472} Ibid, p. 1332.
Darwinian natural selection, offers no solace or support for these traditional hopes about human necessity and cosmic importance. We are, “glorious accidents of an unpredictable process.”

Dawkins agrees, and states that the belief that humanity is a necessary part of, let alone the pinnacle of, creation has been roundly rejected in scientific circles for at least fifty years. Does any process in evolution require a teleological explanation? For Mayr, “The answer is an emphatic ‘No.”’ He is convinced that his life’s work in the field has shown that Darwinian progress is never teleological. He believes that, “… all observed evolutionary trends can be fully explained as being the result of natural selection.” A major objection to theistic orthogenesis for Mayr is that it should result in a consistent directionality in evolution. However, he claims, “… the palaeontologists showed that all evolutionary trends sooner or later change in their direction or may even reverse themselves.” S. Baldauf documents this phenomenon within the eukaryotes. He demonstrates that earlier evolutionary trees, which placed all of the simple eukaryotes at the base, on the assumption that life forms would gain complexity over time, are false. Instead, eukaryotic evolutionary lines show repeated trends towards both complexity and simplification, and look much more like a groundcover or bush than a tree (figure 2).

---

476 Mayr, What Evolution Is, p. 303.

477 By which he means forward looking, or goal directed.

479 Ibid, p. 89.

Figure 2. A consensus phylogeny of eukaryotes, according to Baldauf. The relationships look more like a top down view of a groundcover, than the tall, hierarchical trees, in which simple life forms were thought to give way to more complex ones. Animals are part of the opisthokonts, bottom left.
Mayr’s final point is that natural selection is really a process of elimination, and it is difficult to see how elimination could have long term goals. In summary, for Mayr,

“... the frequency of extinction of evolutionary lineages, as well as their frequent changes in direction, is inconsistent with the mistaken claim that selection is a teleological process... Orthogenesis and other proposed teleological processes have been thoroughly refuted.481”

After interviewing scores of scientists to produce his text, Zimmer accepts that divine guidance is an unnecessary hypothesis, and favours contingency. He maintains that, “The fate of any new kind of animal [humans included] is far from predictable, often depending on random strokes of luck and good fortune.482”

Zimmer is adamant that recent attempts to revive the need for an intelligent designer are without merit. He spends several pages debunking Intelligent Design theory, and examines some of its logical inconsistencies. His primary examples are the evolution of antifreeze and blood clotting agents in blood, both of which have been claimed to be irreducibly complex483. Zimmer complains that when the intelligent design proponents’ “proofs” are explained in other ways, they are able to simply posit the need for design at the previous step484. For example, the supposedly perfect vertebrate eye was long held to be evidence for the need for a designer. The evolution of the eye, which happened at least forty times amongst the different animal lineages485, has now been plausibly explained biologically486.

481 Mayr, What Evolution Is, p. 130-34.
482 Zimmer, Evolution, p. 117.
483 Ibid, pp. 325-29.
485 Mayr, Toward a New Philosophy of Biology: Observations of an Evolutionist, p. 72. It was Mayr and Salvini-Plawen who originally showed this to be so in 1977.
486 Margulis talks about the role of symbiogenesis in the evolution of the vertebrate eye (Margulis and Sagan, Acquiring Genomes, pp. 203-4.) Dawkins explains why even a poor eye is better than no eye, and discusses the computer modelling which suggests that a good vertebrate eye could evolve in less than 500,000 years (Dawkins, River out of Eden, pp. 76-83.)
Equally significantly, the vertebrate eye is riddled with imperfections, hardly the type of organ which points to a perfect, or even particularly intelligent designer.

Intelligent Design advocates have retreated from the design of organs to earlier stages in evolution. Michael Behe, for example, who is a leader in the Intelligent Design movement, focuses on cells. According to Zimmer, Behe speculates that the first cells may have contained all of the DNA needed to make every organism which would evolve. Evolution, then, would consist in the turning off and perhaps removal by mutation of unnecessary genes, not the creation of anything novel. Zimmer simply quotes the response of Allen Orr, “This notion leaves so much of molecular evolution unexplained that it’s hard to know where to start.” This rebuttal is not completely devastating, since Behe’s speculations about the first cell are presented as a speculative scenario to illustrate an unrelated point. Behe’s main argument is that cells contain a mixture of designed and evolved elements. Even so, he is still vulnerable to Orr’s main criticism, which is that Behe ignores the evolutionary processes by which initially beneficial developments in the cell subsequently become essential, because other process come to rely on them. Orr points out that irreducible complexity does not at all imply the need for design. The Darwinian mechanisms by which irreducibly complex features evolve were worked out in considerable detail as early as 1939, by the Nobel prize winning geneticist Muller.

---

490 Behe, *Darwin's Black Box*, p. 206-08.

491 Orr, *Darwin V. Intelligent Design (Again)*. In a gentler, but no less firm, criticism from the theological camp, Peterson concludes that Intelligent Design is, for a number of reasons, more driven by an ideological rather than scientific program (Gregory Peterson, "The Intelligent-Design Movement: Science or Ideology?,” *Zygon* 37, no. 1 (2002).)
Dawkins believes that the hypothesis of God’s guidance of evolution is disproved by science. In a quite entertaining passage he reflects on what God must be like if, indeed, God did actually guide evolution or design life. He notes that cheetahs appear to be well designed to kill antelopes. At the same time, antelopes appear to be well designed to escape cheetahs. He concludes,

“It is as though cheetahs have been designed by one deity and antelopes by a rival deity. Alternatively, if there is only one Creator who made the tiger and the lamb, the cheetah and the gazelle, what is He playing at? Is he a sadist who enjoys spectator blood sports? Is he trying to avoid overpopulation in the mammals of Africa? Is he maneuvering [sic] to maximize David Attenborough’s television ratings?”

So, if antelopes and cheetahs and other bodies are not there because God made it so, why are they? I will shortly give a brief account of the development of bodies. But in terms of the cause of bodies in the absence of Divine guidance, Dawkins has the most to say. The answer to the question, Why are we here is that we are the vehicles which evolved to enable DNA to replicate. Religions often follow the Why are we here question with, Why do we suffer? Dawkins’ answer is that we have not been directly designed by a loving God who would (we assume) therefore want to minimise suffering. We have been created by our DNA, which is indifferent to anything other than its replication (and is, strictly speaking, indifferent even to that),

“So long as DNA is passed on, it does not matter who or what gets hurt in the process…. Genes don’t care about suffering, because they don’t care about anything. If Nature were kind, she

---

493 Dawkins, River out of Eden, p. 105-06. I said that I was ignoring creationism, but in the margins of this quote from Dawkins the battle lines were clearly drawn by an anonymous protagonist in pencil, “In God’s creation the lion can lie down with the lamb- but not so in this world of sin. The purpose of God’s creation was different to the way things are- this is because of the Fall of man and sin in the world.” I could not resist adding a post-it note, “Lions and lambs and all sorts of parasites predate H. sapiens by 00s of millions of years. The lion never did and never will lie down with the lamb, or the world would be overrun by sheep! Isaiah was a poetic prophet, not a zoologist (& he knew it)”. Just had to get that off my chest- sorry.

494 Dawkins is clear that the “selfish” gene is just a metaphor, which can lead to misunderstandings if people do not firmly grasp the limitations of personification. The gene acts as if it were selfish, but of course has no mechanism by which to feel anything at all (Dawkins, Unweaving the Rainbow, p. 233.)
would at least make the minor concession of anaesthetising caterpillars before they are eaten alive from within. But Nature is neither kind nor unkind. She is neither against suffering nor for it... The total amount of suffering per year in the world is beyond all decent contemplation... thousands of animals are being eaten alive; others are running for their lives, whimpering with fear; others are being slowly devoured from within by rasping parasites; thousands of all kinds are dying from starvation; thirst and disease. It must be so. If there is ever a time of plenty, this very fact will automatically lead to an increase in population until the natural state of starvation and misery is restored.\textsuperscript{495}

“In a universe of blind physical forces and genetic replication, some people are going to get hurt, other people are going to get lucky, and you won't find any rhyme or reason in it, nor any justice. The universe we observe has precisely the properties we should expect if there is, at bottom, no design, no purpose, no evil and no good, nothing but blind pitiless indifference.\textsuperscript{496}

“DNA neither cares nor knows. DNA just is. And we dance to its music.\textsuperscript{497}

A final reason to doubt that God is guiding evolution on Earth towards a particular end emerges when we consider just what that end will be, but for that we will have to wait until we consider the future of the image of life in chapter 8.2.9.

To this point in my investigation of evolutionary theory, we have seen the massive sweep of geologic time over which the story unfolds. We explored the limits of agreement about the mechanisms by which life emerged and evolved, noting that there is no evidence that the process was guided by an intelligence. It was, rather, guided by processes completely indifferent to us, except as breeders, or gene transmitters. As Dawkins points out, every single ancestor, of every single one of us, bred before they died\textsuperscript{498}. Before responding to this view of life, which some see as bleak, I shall offer a brief survey of what these evolutionary processes have created. It will be necessary to select just a few highlights from the past three and a half billion years.

\textsuperscript{495} Dawkins, \textit{River out of Eden}, p. 131-32.

\textsuperscript{496} Ibid, p. 133.

\textsuperscript{497} Ibid. I will examine the extent to which DNA, or evolution, controls our actions in the chapter 8.2.5, on morality.

\textsuperscript{498} Ibid, pp. 1-2.
8.2.4 Highlights of the evolutionary story

8.2.4.1 The origin of life

According to Margulis and Sagan, living systems are not ontologically different from non-living ones. Complex systems, including simple life forms, arose in response to the numerous chemical and energy gradients around them. They were the natural consequence of their ability to bring complex systems to equilibrium. Life is explained by its greater efficiency in reducing gradients.\(^{499}\) In an earlier work Margulis outlined what she believed to be a plausible sequence for the evolution of anaerobic bacteria\(^ {500}\), adding to the other five of six major theories about the evolution of life. Mayr believes that although none are entirely satisfactory, several are highly plausible, and the problem of the emergence of life from non-life is now no longer as formidable as it once seemed\(^ {501}\).

Richard Southwood offers one possible story\(^ {502}\). Rather than speculate about gradients as mechanisms, he outlines the, “hard scientific evidence about how simple organic molecules have been formed.” He then looks at the evidence which leads to “informed speculation” about the transition from molecules to simple cells\(^ {503}\). First, the necessary molecules were concentrated, perhaps in hot oceans, near larval flows, on bubbles or clay particles. Secondly, these molecules joined into more complex polymers, which must have happened in areas of high pressure. Some molecules may also have arrived as space debris. Thirdly, an outer membrane formed which allowed a different chemistry to exist inside it than existed in the surrounding medium. Membranes are known to form spontaneously in certain situations, such as that which exists in hydrothermal vents and hot springs. Fourthly, a mechanism to provide energy developed, beginning with glycolysis, which is still the basic pathway in most organisms today. This would

---

\(^{502}\) Southwood, *The Story of Life*, pp. 12-13. His story does not necessarily contradict Margulis and Sagan, he may be describing the mechanisms by which their overarching process came about.

\(^{503}\) Ibid, pp. 11-12.
have eventually ended, and all life died, if not for the evolution of photosynthesis. Ironically, the oxygen by-product which we now depend on wiped out almost all life on the planet at the time. Finally, a mechanism emerged which permitted the replication of these cells, based on nucleic acids. It is likely that RNA appeared first, probably in hot acidic sulphur-laden waters.

The incessant transfer of genetic information amongst these early cells through symbiogenic fusions eventually lead to the eukaryotes. We eukaryotes had very humble beginnings, as we were still single cells, but we had a nucleus and chromosomes. These two features allowed the prolific experiments in multicellularity to begin.

8.2.4.2 The development of multicellular life

Dawkins explores reasons why multicellularity arose in the first place, though he does not offer a definitive hypothesis. He rightly states that most of us simply assume multicellularity, and the existence of organisms, as if it is obvious. From his gene-level point of view, however, it is not immediately obvious why genes should replicate in bodies rather than remaining free-floating. The gene-level story is that replicators in multicellular bodies achieve complex organs and behaviour patterns which offer great selective advantage. In practice, the organism is simply a manifestation of the extended phenotype - the expression of genes, and “has arisen as a partially bounded local concentration, a shared knot of replicator power.” Although not denying the importance of organisms, Dawkins wants us to see them for what they truly are in evolutionary terms, vehicles by which genes replicate. His story goes much further than this, but

504 There are at least thirty significant differences between prokaryotes and eukaryotes, which Mayr summarises (Mayr, What Evolution Is, p. 50.) He points out that bacteria may be multicellular, but they have never expressed anything like the amount of differentiation within each multicellular whole that eukaryotes have (Mayr, What Evolution Is, pp. 53-54.) See also Margulis & Sagan on the common multicellularity of prokaryotes (Lynn Margulis and Dorion Sagan, What Is Life? (New York: Simon & Schuster, 1995), p. 71.)

505 Dawkins, The Extended Phenotype, pp. 250-64.

507 Dawkins has been frequently misunderstood as being a genetic determinist, who believes that we are only our genes, and that our genes completely control us. He addresses this at some length in Dawkins, The Extended Phenotype, pp. 9-29.
we will return to it at the end, and continue to think about the bodies with which we are familiar. Even if we reject Dawkins’ entire project, the story of the evolution of bodies has profound theological implications.

8.2.4.3 The evolution of sex

The next significant step for eukaryotes was the evolution of sexual reproduction. Its success as a strategy is seen in the fact that nearly all eukaryotes reproduce sexually. Yet there has been no simple progression from asexual to sexual reproduction, since those that now reproduce asexually are not more primitive forms, but have forsaken sexual reproduction and returned to asexuality. The near ubiquity of eukaryotic sexuality has puzzled scientists for over a century. Sexual reproduction is more difficult, slower, more dangerous and more costly. Sexual reproduction means that each parent only passes on half of their genome to their offspring. Asexual organisms can reproduce at will, with little risk, and pass on their entire genome. Why, then, go to all the trouble? Why has natural selection not eliminated such a costly process?

The answer almost surely lies in the major difference between sexual and asexual reproduction. In the latter, the only source of genetic variation comes from mutations, which will often be deleterious. In sexual reproduction, the genotypes of two individuals are “shuffled,” leading to great phenotypic variability in the offspring. This variability means that, in the event of a major change in the environment, it is likely that at least some individuals will have the phenotype necessary to cope, or thrive. Sex, in other words, is all about promoting diversity to cope with a changing environment.

The most significant change in the environment, it seems, is that caused by pathogens. Sex is largely a selective response to disease and parasitism. Multicellular asexual organisms evolve only very slowly, with random mutation the driving force. Consider the production of a gamete in sexual reproduction.

---

508 Mayr, What Evolution Is, p. 115.

First, each maternal chromosome aligns in the cell with its paternal equivalent. Crossing over then occurs, in which the aligned chromosomes swap random segments. In other words, each maternal and paternal chromosome now contains parts of the other. Secondly, the cell divides into two gametes, each of which will end up with either the mostly maternal, or mostly paternal chromosome. In this process every gamete produced by an organism will be genetically unique, and so the next generation of organisms will contain great diversity. This means that at least some of the next generation will likely be genetically resistant to any pathogen which confronts them, and these will go on to produce more offspring for the next generation. As the pathogen mutates, the genetic diversity of the host species means that some in each generation will usually survive.

Sexual reproduction arose long before gender. All sex was initially homosexual\textsuperscript{510}. Organisms released haploid gametes, which fused into diploid cells, and grew into multicellular organisms. It is proposed that the gametes were simply released into the water in much the same way as sponge gametes are today. However, this wide dispersal made it likely than many gametes would be wasted. Natural selection favoured life forms in which some retained their gametes, and others dispersed them. Many of course did both, especially amongst the plants. Our ancestors, however, continued to specialise reproductive strategies to the point where two distinct genders arose, leading to the existence amongst mammals of females (XX) and males (XY)\textsuperscript{511}. The pattern is reversed in birds, where males are ZZ and females ZY.

But the existence of such a significant difference in gamete dispersal within most vertebrate species, according to evolutionary theory, should create different selective pressures on each strategy. For convenience, I will adopt the universal convention of calling those who retain their gametes female, and those who

\textsuperscript{510} Well, it was unisexual or asexual, but since there was only one gender we can playfully call it homosexual, significantly undercutting the claim of many Christians that God created the world heterosexual, and homosexual is an unnatural deviance.

\textsuperscript{511} Gender is more plastic than this, for example there are individual mammals with XYY and XXY chromosomes. Although they are infertile, if they are members of a social species, such as humans, they may contribute to the care of related individual’s offspring, and thus enhance the future transmission of their genes.
disperse them male. Females retain their gametes, and the resulting zygote, and can therefore be sure that the zygotes developing within them are genetically half “theirs,” which is a tremendous advantage. At the same time, they often need to provide nutrients to the developing embryos, and may be less mobile whilst doing so. They also often offer protection to the young for a time, at considerable risk to themselves. Males can never be sure that their sperm has fertilised any given eggs, but since sperm production and dispersal is relatively easy, they can increase their chances of having offspring by mating frequently, and with multiple partners.

Zimmer provides numerous examples of the strategies employed by males and females to increase the probability that their genes pass into the next generation. They compete not only with each other, but with members of the same gender for access to each other. To take just one example, many males have preejaculate with a cocktail of chemicals designed to poison any sperm already in the reproductive tract. Others have a variety of appendages to scrape semen out. Females are just as proactive in this evolutionary race. Hens will eject semen if a subordinate rooster mates with them. They prefer roosters with engorged combs, but this requires high levels of testosterone, which leads to premature death. It also increases susceptibility to parasitism, so only very health roosters can sustain it. Indeed, a large amount of female selection of males is thought to distinguish the healthy from those suffering from pathogens. Female hens, then, are selecting for good pathogen resistance in their partner, and thus offspring, which gives them an increased chance of survival.

Male lions, when taking over a pride of unknown lions, often kill any cubs, since none of them will be genetically related. If, however, there are enough lionesses

512 It is actually slightly more than half, since the mitochondrial DNA always comes from the mother.

514 Ibid.

515 Ibid, p. 238.

present, they can defend the cubs, thus preserving their own genes. When lionesses do mate, they copulate hundreds of times in a few days with the dominant male, ovulating only near the end. Only a healthy male, not overburdened with pathogens, is likely to last the distance and so fertilise the female. The females then mate with all the other males briefly, so that all have reason to believe they may be the father, and thus not kill the cubs if they take over the pride in which they have lived for a time. There is some evidence that this sort of male strategy persists in primates, and possibly unconsciously in humans. This is quite possibly, however, an artefact of the extremely stressful situations in which the study populations now live.

We do know that in species where males contribute to the care of young they are uncannily able to detect offspring that are not theirs. This is thought to be why human babies tend to resemble their father’s lineage initially. The stories of species once thought to be monogamous, but now discovered to be otherwise are legion. As Zimmer puts it, “Promiscuity is rampant in the animal world, even in species that generations of scientists had been convinced were utterly faithful,” even though they may live monogamously. For example, amongst birds, though 90% of species are monogamous, up to 55% of chicks are the product of clandestine liaisons, depending on the species. In humans, a study performed in World War Two on something completely unrelated revealed that 25% of children were illegitimate.

---

518 Malcolm Potts and Roger Short, *Ever since Adam and Eve: The Evolution of Human Sexuality* (Cambridge: Cambridge University Press, 1999), pp. 215-16. They report that human stepfathers, for example, are sixty times more likely to kill an infant under two with whom they live than a biological father is.

519 Mary E. Clark, *In Search of Human Nature* (London ; New York: Routledge, 2002), pp. 90-91. Even in captivity, where conditions are crowded but the fear of poaching is absent, male gorillas are rarely hostile to females or infants. The human infanticide study was in western, nuclear family based studies. In many human communities males freely share the care of non biologically related infants.

522 A stupid word which says more about the person who coined it than the people it describes. The WWII study is mentioned in Potts and Short, *Ever since Adam and Eve*, p. 85.
The concept of illegitimacy is itself a very recent invention, being irrelevant in our ancestral, nomadic groups, where there was no property to speak of. According to Malcolm Potts and Roger Short, human sexual dimorphism and our relatively large penises and testicles, among other things, betray the tendency to promiscuity in our past, in which males used their physical bulk to fight off rivals and ejaculated masses of semen in an attempt to “drown out” the competitors. When we entered an agricultural mode of being in our recent past, more stable relationships developed so that each individual could be connected to a family, and thus their right to access of land and resources calculated and inherited. According to Potts, marriage, “is the badge of a polygamous animal struggling to be monogamous.”

Clark accepts Pott’s final conclusion, but was unimpressed by the reasoning he used along the way. She points out that in humans, sexual dimorphism is remarkably small relative to other apes, and male and female attitudes to sex and relationships are very similar, despite popular media reports to the contrary. Under the influence of the popular media we may have read Potts quote about marriage as saying it is, “the badge of a polygamous male struggling to be monogamous.” This would only be true if (as for many animals), sex only occurred when the female was fertile, usually led to pregnancy, and the biological parents bore the burden of caring for the progeny. The first two are not true for humans anywhere, and none are true for humans in many “traditional” societies. None of them have been true for at least some primates, including our ancestors, for a very, very long time.

Clark agrees with Potts that “marriage” arose as small human communities needed to grapple with the concept of property and access to resources. As evidence she points out that in extant nomadic groups sexual relations are relatively uninhibited, and monogamy absent. The whole community, or at least

---

523 Ibid, p. 92, 211.
524 Ibid, p. 82.
several males, help raise each child. She suspects that fairly casual sex amongst members of each small community was probably the dominant form of social structure from the nomadic present all the way back to the Pleistocene, and even further if we include our primate ancestors. We may be getting a good glimpse of our ancestral sexuality in the sexual behaviour of chimpanzees and bonobos.

Chimpanzees and bonobos are genetically almost identical, but are geographically isolated. The former live in areas where survival requires foraging over large ranges, so that females spend little time together and care for offspring alone, whereas males regularly group together to defend territory and hunt. The result is an aggressive society where males dominate and compel females to have sex. This may be caused by the increasing pressures being placed upon chimpanzee colonies by recent human activity. Bonobos, in contrast, live in areas where food is easy to come by, and females spend much time in each other’s presence. They are therefore easily able to repel unwanted advances by the males. Far from becoming a less sexed community as a result, bonobos are extremely promiscuous, both hetero and homosexually, but without the jealous violence often exhibited in chimpanzee colonies. Further evidence that environmental factors, rather than any genetic difference is the root cause, is seen in the much stronger female bonding of captive chimp populations, where food is plentiful, and females protect each other from male aggression.

We might take as a clue from this that humans, who are genetically so similar to chimpanzees, and share many cultural similarities, will exhibit different sexual practices in different conditions, with jealousy and violence not being the inevitable result of male desire to guarantee parenthood, but the symptoms of

527 The next two paragraphs reflect a summary of chimp and bonobo behaviour found in Zimmer (Zimmer, Evolution, pp. 252-56.)
529 From his years of research de Waal concludes that there are, “points of fundamental similarity, but not identity between chimp culture, language and politics.” (Ibid, p. 211.)
societies under stress. It is highly significant that chimpanzees were known and studied long before bonobos. As Frans de Waal, a primatologist, says,

‘Had bonobos been known earlier, reconstructions of human evolution might have emphasized sexual relations, equality between males and females, and the origin of the family, instead of war, hunting, tool technology, and other masculine fortes. 530, 531

It is also probably significant that the Western humans who studied them were the product of very stressful industrial environments far removed from the Pleistocene era in which their brains and basic emotional responses evolved.

The plasticity of human sexuality is even more pronounced than what we witness amongst chimps and bonobos. Even as agriculture and property brought an end to the fairly free exchange of sex,

‘The creative solutions of many traditional societies to coping with sexual passion without disrupting social order put modern Western attempts to legally and morally fuse the two to shame, as distinctly unimaginative, not to mention, unrealistic. 531,’

So, in many and various ways we and our primate ancestors have come together for sex, for fun. Every now and then sex leads to pregnancy. For about nine months the expectant mother’s body does everything that her mammalian ancestors have been doing for tens of millions of years, with about as little trouble. Then, however, the baby needs to get out!

8.2.4.4  H. Sapiens: birth and other compromises

In H. sapiens, almost uniquely, women endure one of the two most painful experiences known to humans, the other being the passing of kidney stones. The authors of Genesis and the oral traditions that preceded them grappled with the

530 Frans de Waal and Frans Lanting, Bonobo: The Forgotten Ape (University of California Press, 1997), p. 2. Clark cites this on page 94. This equality would have included the fact that both males and females enjoy sex and the benefits of promiscuous sex (de Waal and Lanting, Bonobo: The Forgotten Ape, pp. 105,12.) The myth of seed-sowing males being trapped by nest making, intrinsically monogamous females may have some truth to it generally, but only much truth in societies where males and females are usually separated and community fragmented, so sexual encounters are less easy to arrange, women rely on men for income, and are forced to care for any offspring they may have alone.

531 Clark, In Search of Human Nature, p. 244.
questions raised by the pain, and occasionally death, associated with human childbirth\textsuperscript{532}. Their solution was to blame the fact on female disobedience,

\begin{quote}
“Then the LORD God said to the woman, "What is this that you have done?" The woman said, "The serpent tricked me, and I ate... To the woman [God] said, "I will greatly increase your pangs in childbearing; in pain you shall bring forth children...\textsuperscript{535}"
\end{quote}

Logically, of course, in the story the blame finally lies with God. Humans may have sinned, but God chose the punishment. There has been an abundance of theological deliberation about the justice or otherwise of a God who would do such a thing. Fortunately, evolutionary biology brings an end to the need for the discussion. The “blame” for the emergence of difficulties in childbirth lies not with rebellion, nor God, but the move towards a bipedal lifestyle and the corresponding changes in the pelvis\textsuperscript{534}. The subsequent increase in the cranial size of \textit{H. sapiens} made birth much worse. Birth is, it seems, a compromise between our evolving brain size and the limitations of the body type evolution has bequeathed to human women. Human babies are, relative to our nearest ancestors, born with great difficulty and extremely prematurely. Full human gestation, if head size was not an issue, would be about 21-26 months\textsuperscript{535}. Human babies would, then, like our nearest ancestors, actually be able to assist in the birthing process, and be much more independent.

Perhaps human birth difficulties \textit{are} the result of God’s design. We could hypothesise that God really is male, and thus little concerned for the intricacies of female anatomy, or perhaps even their pain. This hypothesis is undone by the convoluted way in which the human male urethra passes around the prostate. The

\textsuperscript{532} Humans are not totally unique. Domestic livestock do have difficulties, but they have been artificially bred for other traits, of which difficult birth may be a by product. A wild cow with a prolonged labour is an eaten cow. Gorillas and chimpanzees (unknown to the Hebrews) do appear to experience pain in birth, but the labours are much shorter, typically two hours (Potts and Short, \textit{Ever since Adam and Eve}, p. 131.)

\textsuperscript{533} Genesis 3:13-16.

\textsuperscript{534} The following summarises Southwood, Rosenberg and Trevathan (Karen Rosenberg and Wenda Trevathan, "The Evolution of Human Birth," \textit{Scientific American} 13, no. 2 (2003), Southwood, \textit{The Story of Life}, pp. 225-26.)

result is that an inflamed prostate, which affects at least half of all males, is extremely painful, and sometimes fatal\textsuperscript{536}. It could be completely avoided with better anatomical design, but prescient design is not a possibility for natural selection works. S. Jay Olshansky \textit{et al}. detail a considerable list of “design faults” in the human body, primarily ones that become apparent with age. In a somewhat humorous article they make the serious point that,

“… natural selection… does not aim for perfection or endless good health. If a body plan allows individuals to survive long enough to reproduce (and, in humans and various other organisms, to raise their young), then that plan will be selected.\textsuperscript{537}”

Along with “design faults” almost all bodies contain vestigial remnants, or useless anatomical structures. They exist because they were once essential to the survival of the organism’s ancestors. For example, some whales still have legs- tiny vestigial ones which are visible only on the skeleton- and some snake pelvises still have small nubs\textsuperscript{538}. Such remnants are overwhelming evidence of the common descent of species from ancestral types. They are also evidence of the constraints under which natural selection operates (see page 42, above), which leads to the favouring of organisms who have better phenotypes for a given environment, rather than the best possible of all phenotypes. Hence, primate bipedalism was favoured on the plains of Africa because it enhanced survival overall, even though it led to increased pain, and even mortality in the moment of child-birth.

\underline{8.2.4.5 The “falls” of Creation- mass extinction events}

Enhancing survival prospects does not ensure survival. There are a myriad of chance events which constantly impact on individual mortality. Superimposed on this sea of contingency are the regular and spectacular mass extinction events which wipe out not just individuals, but entire ecosystems. In the evolutionary

\textsuperscript{536} S. Jay Olshansky, Bruce Carnes, and Robert Butler, "If Humans Were Built to Last," \textit{Scientific American} 13, no. 2 (2003): p. 99. The lack of reflection on this problem in Genesis may be due to the shorter life spans of most males at the time, which would have saved them from this medical condition.

\textsuperscript{537} Ibid: p. 95.

\textsuperscript{538} Gould, "Introduction," p. xi.
story of life, Earth’s biodiversity has “fallen” at least five times\(^539\). Life as we know it is totally dependent on death, and lots of it.

The first mass extinction probably occurred about 2000mya, when oxygen producing microbes evolved\(^540\). Ironically, given that oxygen is essential for most organisms now living, it was fatal to the anaerobic microbes that then covered the planet. Their almost total extinction paved the way for the aerobes like us. Sagan and Margulis point out that this event, not the one we are currently experiencing, was the first species driven mass extinction\(^541\).

Whether initiated by life forms, geological processes or extraterrestrial events, it was the resulting environmental changes which triggered the mass extinctions. Those organisms that perished may have been extremely well adapted to the environment as it was just before the cataclysm. Indeed, “A perfectly adapted species is always in the greatest danger in times of rapid (in evolutionary terms) change.”\(^542\) That is, life did not only evolve by the gradual out competing of ‘outmoded’ organisms by better adapted ones. It did not evolve by the continual emergence of better designed versions of organisms. Massive cataclysms wiped out the most successful organisms of the time and thus vacated niches for previously less well adapted organisms to take over. A simplified illustration is provided in figure 3\(^543\), which documents the extinction rates of marine invertebrates.

---

\(^{539}\) Though never to quite to the extent as that pictured in the stories of the flood and Noah’s Ark!

Figure 3. A history of marine invertebrate extinctions. Palaeontologists agree that there were at least five of the larger peaks represent mass extinction events on the entire Earth. The last peak represents the mass extinction event which brought the dinosaurs to an end. Note that this includes only the last 550 million years, before which the data are too sketchy.
Though this documents the timing well, the impact on land animals of some of the extinction events was even more marked. The best known extinction is probably the Cretaceous/Tertiary extinction, which wiped out the dinosaurs. Thirty five percent of mammal species were also wiped out, and seventy five percent of plant species in North America went extinct. Those that could survive did so largely as seeds. Any creatures that were part of a food chain reliant on leaves perished. Until this event, the dinosaurs had been the dominant vertebrates on Earth for a period of 150 million years. In all that time the mammals, far from being more “advanced,” were not able to out compete them,

“We think of mammalness as the superior way to be. It wasn’t. Dinosaurs in head-to-head competition won out. They took over the world. We talk about an age of dinosaurs - well, they wrested it away from mammals.”

It was not until a comet slammed into Earth, shrouding it in darkness for several weeks, that mammals got their chance. Small, carrion eating, rat like mammals were able to explode into a variety of body plans to take advantage of the enormous number of ecological niches which were emptied with the death of the dinosaurs. Likewise, the birds finally gained a foothold with the extinction of the pterosaurs. Our ancestors are the vermin who feasted on rotting dinosaur corpses.

The dinosaurs themselves only became numerous after the greatest multicellular extinction event ever, about 250mya. During the formation of the super continent Pangaea, two events combined to wipe out about 95 percent of all marine species, and over half of the families of marine organisms. The two events, which occurred about eight million years apart, was massive volcanic activity around Siberia, and a suspected comet strike. Eight orders of insects disappeared, and the dominance of the early amphibian and reptile types was ended. So extensive

545 Ibid, p. 140.

546 Southwood, The Story of Life, p. 158.

547 Ibid, p. 117.
were the changes that Southwood concludes, “The wonder is perhaps not that so many species became extinct, but that any survived at all.”

So, then, *H. sapiens* is the beneficiary of the mass extinction of almost all species of life on Earth; between 99 and 99.99% of those that have ever existed are now gone. At the same time, the number of species at any one point in time shows a general increase over time, so that *H. sapiens* arrived at a time of probably maximum biodiversity on Earth. Mass extinctions continued after the evolution of *H. sapiens*, though not yet on as grand a scale as those mentioned above. For the past 10,000 years we have experienced a warm lull in a period of repeated glaciations, which inevitably led to widespread, localised extinctions of humans and other species. A worse catastrophe was the eruption of Mount Toba approximately 70,000 years ago, which shrouded most of the planet in darkness for seventeen years. Many human communities must have perished, their lands recolonised by those groups who were lucky enough to survive.

No species has ever survived for more than tens of millions of years, and most have survived for much shorter periods of time. The average “life expectancy” of a mammalian species is just three million years. This limit may not apply to us, since we (or at least the rich amongst us) have technology like nothing ever before seen on Earth. This technology may help our species persist much longer than three million years. On the other hand, many suggest that it may greatly curtail the persistence of our species, by rapidly changing the environment into one unsuitable for our continued habitation. That is, we are presently in the midst of another mass extinction event. How does this one compare to those which preceded it?

548 Ibid.

549 Margulis & Sagan propose 99% as a conservative figure (Margulis and Sagan, *Acquiring Genomes*, p. 52.); Mayr believes that the figure is at least 99.99% (Mayr, *What Evolution Is*, p. 155.)

552 Ibid, p. 115.

8.2.4.6 The human initiated “fall” in the context of preceding ones

“Human beings and the natural world are on a collision course. Human activities inflict harsh and often irreversible damage on the environment and on critical resources. If not checked, many of our current practices put at serious risk the future that we wish for human society and the plant and animal kingdoms, and may so alter the living world that it will be unable to sustain life in the manner that we know. Fundamental changes are urgent if we are to avoid the collision our present course will bring about...\textsuperscript{554}"

So said a coalition of 1,700 scientists from around the world, including the majority of science’s Nobel laureates, in 1992. Five years later, the coalition had this to say,

“Addressed to political, industrial, religious, and scientific leaders, the Warning demonstrated that the scientific community had reached a consensus that grave threats imperil the future of humanity and the global environment. However, over four years have passed, and progress has been woefully inadequate. Some of the most serious problems have worsened. Invaluable time has been squandered because so few leaders have risen to the challenge.\textsuperscript{555}"

After a very protracted labour the Uniting Church was born in 1977, in the midst of the growing awareness of an ecological crisis. The reality of the crisis was well enough acknowledged for Lynn White to simply assume its existence when laying the blame for it on Christianity\textsuperscript{556}. As we saw in chapter 6, every document produced by the Uniting Church which mentions creation acknowledges some level of crisis, and calls on its members to do something about it.

We have seen that at least five times in history life on Earth has been subjected to massive extinction events. As Zimmer puts it,

\textsuperscript{556} White, "The Historical Roots of Our Ecologic Crisis."
“Catastrophic waves of extinctions are a reality. They have ripped through the fabric of life, destroying as much as 90 percent of all species on earth in a geological instant. The suspects behind these mass extinctions are many, including volcanoes, asteroids, and sudden changes to the oceans and the atmosphere… once that stress passes a certain threshold, entire ecosystems collapse like a house of cards… it takes millions of years for life to recover its former diversity… life can change for good."  

It is widely accepted that if present trends continue, half of the species on Earth that were present before the industrial revolution will be extinct within 100 years. Is this latest, human mediated, extinction event any different from the ones that precede it? Yes and no.

1. Previous events have often occurred as the result of numerous interacting factors spread over hundreds of thousands or millions of years - still a geological instant, but orders of magnitude slower than the human initiated event. For example, the “geological instant” of the Permian-Triassic extinction occurred over approximately 150,000 years.

2. Previous events happened when parts of the world were more isolated form each other, and heterogeneous. Under human agriculture, especially agribusiness, the plant world is becoming far more genetically homogenous. The same is true for animals following the explosion of cattle, sheep, chickens and other domestic livestock. Humans also provided easy transport for a few animal species which have become highly successful invaders, displacing significant numbers of native species. In Australia foxes and rabbits have displaced more than half of our native mammals. Biological invasion on this scale is unique in world history, and equals habitat clearance as a threat to biodiversity. Zimmer points out that extinction of 50% of species over the next century is calculated only by the rate of habitat clearance, and does not take into

---

558 Ibid.  
559 Ibid, p. 191.
account biological invasion or climate change patterns. For example, if global warming trends continue, most of the world’s reefs could be destroyed in just twenty years\textsuperscript{560}.

3. Although ninety percent of species were thought to go extinct during the Permian-Triassic event 250 mya, there were far fewer species then to begin with. Biodiversity was at an all time high when \textit{H. sapiens} arrived. A 50\% human mediated extinction means many, many more forms of life disappearing than ever before in world history\textsuperscript{561} On the other hand, since there \textit{is} so much diversity now, this 50\% extinction would return Earth to roughly the same number of species as occurred after the dinosaur extinction (figure 4).

\textsuperscript{560} Ibid, p. 184.

\textsuperscript{561} Ibid, pp. 169.
Figure 4. Growth in number of genera over time, a very rough measure of diversity
4. When a comet hits Earth, it only does it once. Volcanos may erupt for years, but they eventually stop. Glaciers come and go. As long as humans somehow manage to survive by the use of technology, there will be no recovery of biodiversity as seen after previous extinction events. This may be exacerbated for a time by the widespread existence of human modified crops and livestock, though eventually they will succumb to pathogens, since there will be enormous selection pressure in favour of any mutant able to exploit them as a resource.

5. This extinction event is being caused by a single, sentient species, not a comet or geological process. Specifically, it is being caused by some members of a single species with the aid of their technology. This species is able, at least theoretically, to change its behaviour and thus ameliorate its impact.

It is also worth noting what may be similar amongst all extinction events, including this one. Firstly, the dominant species at the time of the extinction event tend to go extinct. This may be the end of primates, even of mammals, just like the last event was the end of the dinosaurs. Secondly, it was the superposition of several independent events which caused the mass extinctions. The predicted 50% reduction in species numbers is based on human activity alone. However, Earth will experience more ice ages, continental drift, volcanic eruptions, and comet strikes. If these follow closely upon the human mediated extinctions, there may be a global collapse of ecosystems, especially as we are making them more homogenous. This could lead to a total extinction of all macroscopic life forms.

Would life eventually recover? That seems certain. Even if every vertebrate and plant was wiped from the face of Earth, most of the microbes, who are the major shapers of our bio systems, would continue to thrive and evolve. Simple eukaryotic organisms would probably survive and continue evolving. Of course the path of evolution would be different, and life would not return to the way it is now. If all vertebrates were wiped out it is unlikely that they would evolve again,
at least not with the same basic body plan. Even more likely is the extinction of all primates, and we would not expect to see them ever return. Indeed, the odds of intelligence as we understand it evolving again are probably slim.

There is one prominent metaphor in the campaign to educate people about the present mass extinction event, the *web of life*. It is the key metaphor for those promoting a biocentric perspective in the Uniting Church resources. I shall now consider this metaphor, and two competing claims about the nature of the ecological systems which it describes. Are we looking at a web of cooperative or competitive interactions? Is the web benign (as the Uniting Church resources assume) or malevolent?

**8.2.4.7 The story of the Web of Life**

The metaphor of a web of life is widely used in ecology\(^562\), to emphasise the interrelationship of all organisms and their abiotic environment. It has featured prominently in environmentalist literature since the beginning of the movement\(^563\). We have seen that although the web of life has been devastated and repaired itself through geologic history, it is currently being frayed faster than at any time before. What *is* this web of life though? We know that it is a system of ecological interactions, but what is the *nature* of those interactions?

The resources in the Uniting Church have a very positive view of the beneficence of the web. As I demonstrated earlier, they present an image of an ecological system which is *delicate, perfectly designed, intimate, interdependent, beautiful, delightful to God and good*. Humans are called to return to their proper place in the web - a place of cooperation for the good of all other species.

This very positive view of the nature of relationships amongst creatures is common in the environmentalist literature\(^564\). It calls to mind the discredited

\(^562\) For example Ibid, p. 190.

\(^564\) Dawkins labels this the “BBC Theorem” (a little unfairly he admits), as nature documentaries so often speak of the delicate balance of nature, in which every animal plays its part for the good
version of the Gaia hypothesis\textsuperscript{565}, in which the world is seen as a network of interrelated species which cooperate to build stable ecosystems. In such a view the task of humanity is to remember our place in the web of life and cooperate with other species, rather than standing over against them. Often Indigenous societies are pointed to as reminders of a time when we did indeed live as one with nature\textsuperscript{566}. This approach to ecologically grounded ethics persists today. A quick internet search for “nature AND harmony AND cooperation” returned 193,000 references\textsuperscript{567}. Scanning the first paragraphs of the first fifty showed that the large majority were advocating the return of humanity to its pre-technological harmony with nature, which is often referred to as a cooperative system of some sort.

A movement which on the face of it assumes and successfully utilises the cooperative web of life is Permaculture. This is an Australian born movement for sustainable agriculture of which I am a faltering part. Permaculturalists attempt to grow food in cooperation with the natural processes of Earth, rather than trying to fight and overwhelm them, as broad scale monocultural agriculture does\textsuperscript{568}. Permaculture is an excellent introduction to the wider issue of the cooperativeness or otherwise of life as we know it. As Bill Mollison, who coined the phrase permaculture puts it,

“Permaculture (permanent agriculture) is... the harmonious integration of landscape and people providing their food, energy, shelter, and other material and non-material needs in a sustainable way. Permaculture design is a system... which functions to benefit life in all its forms... working with, rather than against, nature (emphasis mine).\textsuperscript{569}.”

\textsuperscript{565} Chapter 8.2.2, page 42.

\textsuperscript{566} I have already mentioned sources which suggest that Australian Aboriginal people significantly modified the landscape through the use of fire (page 42). Birch and Diamond also question the romantic attitude of some environmentalists to indigenous relationships to the land, as I will show on page 42.

\textsuperscript{567} Search performed February 2004 at http://www.google.com.au

\textsuperscript{569} Ibid. These sentiment continue to be part of the movement, as evidenced by the plagiarism of this paragraph by Geoff Lawton, of the Australian Permaculture Research Institute in 2003 (Geoff
“Life is cooperative rather than competitive, and life forms of very different qualities may interact beneficially with one another and with their physical environment… Cooperation, not competition, is the very basis of existing life systems and of future survival (emphasis mine).”

Good permaculture systems incorporate dozens to hundreds of food bearing species of plants, interacting with scores of insects and a few vertebrates such as frogs, lizards and chickens. In the edible gardens I helped establish at the University of Queensland we used our knowledge of natural processes to gain a reasonable yield of food with minimal effort and zero use of poisons and artificial fertilizer. But to what extent did we actually cooperate with the organisms in the garden? To what extent did they cooperate with each other? It became clear to me that we were not simply cooperating with the system as a whole. We were cooperating with those parts of the system that would bring us benefit. We planted flowers to make the garden a good place for wasps to live, but only because they would prey on the caterpillars. We planted different species where they would grow best, but only to maximise the yields to us. In other words, the garden was a series of competitive systems in which some cooperative alliances persisted because of the mutual advantage they brought the cooperating parties over against the others. The conscious human participants were consciously selfish - seeking our own gain through the manipulation of other species.

At times we did transcend this selfishness. I found earwigs devastating a bok-choi, and decided to leave them alone because I didn’t feel like killing them. We accepted a certain amount of loss of food. But this was only because we could afford to. Permaculture for relatively wealthy westerners like me is a hobby. There was more bok-choi, really cheap, at the supermarket. If I lived entirely off the garden, the earwigs would have perished. Or, perhaps I would have reminded myself that they are good predators of codling moth, and been willing to lose a bok-choi if it meant keeping the apples. But then it would have been my self

centred action against the codling moth, not my benevolence, which spared the earwigs.

Permaculture, then, is not really about cooperating with nature, it is about manipulating other organisms to maximise benefit to ourselves. It is about forming cooperative alliances against common threats to resources. It is about recognising that in modern agriculture humans foolishly take on the entire ecosystem and fail to see that the short term victories cannot last, as evidenced by increasing top soil loss, salinisation, river pollution, and reliance on poisons and petrochemicals.

Gary Larson, famous for his cartoons about biology, lampooned the human propensity to naively see cooperation in nature. It may be telling that very shortly after it arrived in Australia the book was selling on discount tables for $4.95 rather than the original $24.95 price tag. As Edward O. Wilson said in his foreword to the book, Larson set out to show his readers that nature really is red in tooth and claw, and that,

“... while it is true that all organisms are dependent on others, the ecological web they create is built entirely from mutual exploitation. Life is tough... what one creature consumes, another must provide!”

The web, then, is not perfectly designed, but the result of natural selection of competitive organisms. It is certainly intimate and interdependent, but only because the genes and their bodies are locked in competition for resources. It is not delicate, but robust because all species, ourselves included, are expendable, and any niche which becomes available will be rapidly filled. A broken strand in the web is quickly replaced.

Is this vision of life so fatalistic that it will discourage us from taking action, action to which ecotheologians unanimously call us? It has not stopped me being

---

involved in all manner of campaigns to reduce our impact on other ecosystems. I note that Wilson concludes his foreword to Larson’s book by affirming that, “Nature is to be loved, cherished, admired, and yes, even poetically celebrated,” before imploring the reader to watch where they step, and, “be careful of little lives,” because we do still, after all, need each other.573

Do we only care for other creatures because we need them? Are we so cynical? Are our apparently loving and benign actions merely self delusions, a thin veneer pasted over our selfish nature? When we act in ways we consider moral, are we winning a war against our brutish instincts?

8.2.5 Morality emerges from the amoral Web

Dawkins seems to argue that our morality comes from outside evolution, hopefully saving us from its consequences,

“We should try to teach generosity and altruism because we are born selfish574 … We, alone on earth, can rebel against the tyranny of the selfish replicators575.”

de Waal argues that in these quotes Dawkins is actually promoting Huxley, not Darwin576. Huxley and Dawkins are labelled “veneer theorists” by de Waal, since they present human morality as, “a thin veneer over a brutish nature.577” The claim that Dawkins is Huxleyan sparked heated debate on the evolutionary psychology email list in February 2004. de Waal acknowledged that Dawkins claims the selfishness of genes to be just a metaphor578, which risks misunderstanding by those who do not understand personification579. When Dawkins talks about selfishness he is not looking at conscious selfishness and

573 Ibid.
574 Dawkins, The Selfish Gene, p. 3.
575 Ibid, p. 201.
577 Frans de Waal, email, 10 February 2004.
579 Dawkins, Unweaving the Rainbow, p. 233.
altruism, or even subconscious motives, but only on the net effect of the perpetuation of genes.\footnote{Dawkins, \textit{The Selfish Gene}, p. 4.}

Nevertheless, de Waal is correct in pointing out that Dawkins seems to muddy his own distinctions, and de Waal has reasonable grounds for claiming that the selfish gene model is the, “single most misleading metaphor [in evolutionary biology]”,\footnote{Frans de Waal, email, 11 Feb 2004.} especially when Dawkins explicitly endorses Huxley, mistakenly conflating his views on morality with Darwin’s, as for example in an interview with Frans Roes,

> “What I am saying, along with many other people, among them T. H. Huxley, is that in our political and social life we are entitled to throw out Darwinism, to say we don’t want to live in a Darwinian world… Yes, Darwinism is true, natural selection is the true force that has given rise to life, but we, when we set up our political institutions, we might say we are going to base our society on explicitly anti-Darwinian principles… We have to get our ‘shoulds’ and our ‘oughts’ from some other source, not from Darwinism. \footnote{Frans Roes, \textit{Your Can Survive without Understanding. Interview with Richard Dawkins} [internet] (1996 [accessed 1 July 2004]), available from http://www.froes.dds.nl/DAWKINS.htm.}\footnote{Ibid.}

According to de Waal, Huxley and Darwin had very different views on the evolution of morality. Huxley taught that morality does not come naturally to us, indeed, human nature is essentially evil, a product of a nasty and unsympathetic natural world\footnote{Jessica Flack and Frans de Waal, “‘Any Animal Whatever:’ Darwinian Building Blocks of Morality in Monkeys and Apes,” \textit{Journal of Consciousness Studies} \textbf{7}, no. 1-2 (2000): p. 1.}. de Waal and Jessica Flack, his then research assistant, claim that Huxley rejected the power of evolution and biology in the search for morality’s origins\footnote{Ibid.}.

Like Dawkins, Huxley’s statements appear at times contradictory. Early in his famous lecture on the evolution of ethics, Huxley appears to guardedly accept that there may be evolutionary precedents for morality,
“[Evolutionary ethicists] adduce a number of more or less interesting facts and more or less sound arguments in favour of the origin of the moral sentiments... by a process of evolution. I have little doubt, for my own part, that they are on the right track... Cosmic evolution may teach us how the good and the evil tendencies of man [sic] may have come about; but, in itself, it is incompetent to furnish any better reason why what we call good is preferable to what we call evil than what we had before. Some day, I doubt not, we shall arrive at an understanding of the evolution of the Aesthetic faculty; but all the understanding in the world will neither increase nor diminish the force of the intuition that this is beautiful and that is ugly."

Huxley rejects both optimism and pessimism about the world. On the one hand, he wants to reject optimistic portraits of evolution as leading us inevitably to a better and better future and thus human morality. On the other hand, he is rejecting the attempt to directly translate the apparent “law of the jungle” into human ethics, where the strong should thus be allowed, even encouraged, to trample the weak. He accepts that morality may have evolutionary origins, but rejects the idea that we have evolved to become any more moral than immoral, or that our evolutionary past should be prescriptive for our ethical present. In his preface to Evolution and Ethics, he affirmed, in response to ongoing criticism, “…the apparent paradox that ethical nature, while born of cosmic nature, is necessarily at enmity with its parent... this seeming paradox is a truth, as great as it is plain, the recognition of which is fundamental for the ethical philosopher. We cannot do without our inheritance from the forefathers who were the puppets of the cosmic process; the society which renounces it must be destroyed from without. Still less can we do with too much of it; the society in which it dominates must be destroyed from within.”

585 Thomas Huxley, Evolution and Ethics and Other Essays [web page] (1893 [accessed 4 March 2004]), available from http://etext.library.adelaide.edu.au/pg/etext01/thx2010.txt. Tags 79-80 (E-texts do not have physical page numbers corresponding to any one extant paper edition of a book, but are tagged with square parentheses to enable more specific referencing)

586 Ibid.

587 This view, Huxley thinks, was diminishing except amongst the rich, who were somewhat buffered from the trials of life (Ibid.)

589 Huxley, Evolution and Ethics and Other Essays.
Subsequently, however, Huxley appears to contradict himself, or at least the optimistic element fades, and the need to battle our evolutionary past comes to the fore,

“Social progress means a checking of the cosmic process at every step and the substitution for it of another, which may be called the ethical process; the end of which is not the survival of those who may happen to be the fittest, in respect of the whole of the conditions which obtain, but of those who are ethically the best… what we call goodness or virtue… is opposed to that which leads to success in the cosmic struggle for existence. In place of ruthless self-assertion it demands self-restraint… it requires that the individual shall not merely respect, but shall help his fellows… Laws and moral precepts are directed to the end of curbing the cosmic process and reminding the individual of his duty to the community (emphasis mine).”

When the first of Huxley’s quotes, above, mentions, “those who promote the evolution of ethics,” he surely includes his friend Charles Darwin, who had stated,

“… the first foundation or origin of the moral sense lies in the social instincts, including sympathy; and these instincts no doubt were primarily gained, as in the case of the lower animals, through natural selection.”

Darwin separates this basic morality from the advanced forms, to be found in “civilised society,” which he doubted were the result of natural selection,

“With civilised nations, as far as an advanced standard of morality, and an increased number of fairly good men [sic] are concerned, natural selection apparently effects but little; though the fundamental social instincts were originally thus gained.”

Darwin, then, is apparently more optimistic than Huxley that evolution led to moral virtue, but he agrees that the “higher” levels of human ethical endeavour have little to do with evolution. He does not agree with Huxley that they

---

590 Ibid. Goslee also sees contradictions in Huxley’s work, especially between Huxley’s main essay, and the prolegomena he later added to it. Goslee believes that these contradictions are largely the result of Huxley’s attempt to respond to various critics, so that his essays preserve, not a single, pivotal argument, but, “some of the least compatible positions within the current debate.” (Goslee, ”Evolution, Ethics and Equivocation,” pp. 138-39.)

592 Ibid.
necessarily run *counter* to natural selection though. Darwin separated morality into lower and higher forms because he could not conceive of a mechanism which would enable natural selection to favour those who sacrificed their lives for others, though he could see how a tribe or society which contained such individuals would prosper over its enemies.

This problem was first addressed in the theory of kin selection, which showed that the sacrificial death of an individual could still be a selective advantage if it lead to the survival of family members who contained many of the same genes. To the theory of kin selection was added the discovery of reciprocal altruism, a term coined by Robert Trivers in his classic paper of 1971[^593]. Reciprocal altruism occurs when it benefits individuals to help those from whom they may reasonably expect help later. Trivers also argued that reciprocal altruism readily explained human altruistic behaviour without the need to appeal to group advantage[^594]. Reciprocal altruism predates humanity by hundreds of millions of years, stretching back at least as far as the evolution of systems where small fish and even invertebrates clean larger ones[^595]. Once primates, and especially humans, evolved, this same reciprocal altruism formed the biological basis for our sense of justice and fairness. So says Frans de Waal, whose opposition to Dawkins and Huxley results from his extensive work as a primatologist.

His work is detailed comprehensively in *Good Natured: The Origins of Right and Wrong in Human and Other Animals*[^596]. As one example of his work, de Waal documents the conditions in which sharing has evolved in primate groups, and how this affects subsequent behaviour. He found that food is shared if it is nutritious, but prone to decay; comes in bulk quantities; is only occasionally available; and most effectively gained through collaboration[^597].

[^596]: de Waal, *Good Natured*.

best fits this category, and he found that primates will share the proceeds of a hunt, even though they do not share fruits and other vegetable matter. In species where the meat is shared with all, even weak members will call the attention of game to the stronger. If the hunters keep the meat for themselves, those who do not expect to receive a share will not alert the group to nearby prey.

If it is true that hunting was a key factor in the development of sharing, then, as De Waal concludes, “human morality is steeped in blood.” Are all other supposedly moral deeds, like sharing, really selfishness in disguise? As stated above, de Waal believes that the use of the term, “selfish” is highly problematic in discussions about the evolvability of morality. He argues that we must clearly distinguish between self-interest, which is usually unconscious, and selfishness, which is an active decision to achieve ends at the expense of others. So defined, selfishness is rare in nature, but self-interest is the very fabric of life. That is,

“…our behaviour evolved to serve our own interests first of all. This opens the door to the possibility that our interests are best served by doing good for others.”

Peter Singer agrees, arguing that sociobiology does not imply we are all selfish in any normal sense of that term. Nonetheless he talks about the need to “overcome evolution” since it cannot account for non-reciprocal altruism, even if evolution has pushed us in the direction of an expanding circle of concern towards non-rational altruism. Having started out sounding very much like de Waal, in his limited acceptance of sociobiology, Singer seems to drift into the Huxleyan camp, because he has not adequately separated the Darwinian and Huxleyan world views,

“Understanding how genes influence us makes it possible to change that influence. The basis of this challenge must be our capacity to reason… Reasoning beings are therefore in the position of the computers which in science-fiction tales rebel against their creators… Evolution works slowly, and we may

---

598 Ibid, pp. 144-46.
599 de Waal.
well learn to control it in time to avoid disastrous errors… When we know more [about human genetics and how it affects our behaviour] we will truly be able to claim that we are no longer the slaves of our genes. 602.

Unfortunately, this confusion means that human morality becomes a struggle against our evolutionary story, our genetic ‘masters.’ Our moral salvation appears when rationality evolves, which allows us to act in ways which make no evolutionary sense. 603.

Flack and de Waal do not make the same mistake. They undertook a comprehensive review of primatology, which confirmed de Waal’s earlier findings,

“Many nonhuman primates… have similar methods to humans for resolving, managing, and preventing conflicts of interests within their groups… reciprocity and food sharing, reconciliation, consolation, conflict intervention, and mediation… [displaying] empathy, sympathy, and sometimes even community concern. 604.

In other words, all of the behaviours, and emotions which we consider to be part of moral behaviour, already exist in our pre-rational primate relatives. Human rationality evolved alongside morality, it did not create it. Our morality is not a thin rational veneer struggling to contain the bloodthirsty animal within, it has an intrinsic part of us, bloodthirsty animal that we sometimes are.

Building on de Waal’s work, Mary Clark, once biologist and now conflict resolution trainer, seeks to “downplay the majesty of our conscious intelligence [rationality] as the centrepiece of Who We Are. 605. Unlike de Waal, she also

602 Ibid, pp. 169,73.
604 Flack and de Waal, "Any Animal Whatever," p. 1. Recent brain scan studies provide additional evidence that other species may experience empathy (Christian Keysers et al., "A Touching Sight: SII/Pv Activation During the Observation and Experience of Touch," Neuron 42, no. 2 (2004).)
605 Clark, In Search of Human Nature, p. 57.
downplays the importance of “bloodthirsty” hunting in the evolution of primate morality. Clark shows that the typical picture of small human bands shaped by hunting and inter-group conflict is based on very scant evidence. She claims that a more plausible story is that the human brain enlarged and evolved in an environment dominated by waves of glacial and interglacial periods, leading to frequent local extinctions. In such variable and often harsh environments, those small groups of humans who were able to communicate and cooperate, and find effective ways to limit aggression, were more likely to survive. Here Clark advocates *group selection*, discredited in chapter 8.2.2. At the level of small human communities, however, it has more credibility, because of the relatively few generations in which selfish members within the group could outbreed others, and because Clark’s definition of group selection includes many elements of reciprocal altruism and inclusive fitness.

Against a common assumption in sociobiology, she believes that there was little conflict between groups, due to their sparse distribution, so the idea that violent tribes displaced others is unfounded. By contrast, groups which promoted violence were less likely to persist, since they would not be able to cooperate well together. For relatively small groups in the Pleistocene, as for some primate groups in the wild today, explosions of violence were easily avoided in times of intra-group conflict either by sending individuals to other groups, or fissioning the group into two. Clark is not rejecting the possibility of human violence, indeed she documents it at length. She disagrees, however, that violence is inevitable or a core part of our nature. Instead, it is a behaviour which emerges in response to highly stressful situations. What these situations have in common is that they

---

608 Ibid, p. 123.
609 Ibid, p. 125. Clark argues that primate violence in zoos is often due to the inability to form separate groups or exile individuals. She documents the same phenomenon even in the wild, since many chimpanzees are now confined to tiny remnants of forest (Clark, *In Search of Human Nature*, p. 123.)
lead to a breakdown in the ability of humans (and other primates) to fulfil their true basic drives.

The first drive is for bondedness, or relationships, which begins at birth with our absolute dependence on bondedness to another (mother, then father, then the whole group) for survival. In tension with this is the innate drive for autonomy, by which Clark means not independence as much as having one’s own identifiable place within the community, being able to contribute to the life of the community freely and creatively. To alleviate the conflicts these desires create within the individual and amongst group members, our expanding brain and developing language helped create increasingly complex meaning systems (culture). The drives for bondedness and autonomy are shared by primates, whilst the desire for meaning appears to be a human phenomenon, though perhaps chimps prefigure it.

Clark argues persuasively that sociobiologists focus on violence and sexual drives as core constituents of humanity because they have predominantly grown up in western industrial, hierarchical cultures which are dysfunctional. They then usually study other people who live in western, industrial hierarchical cultures as if they were the norm of humanity, rather than an extremely recent aberration.

A recent addition to the largely chimp based evidence for this line of thinking comes from a report of a study of a group of baboons, which almost always exist in violently maintained hierarchies. Through a curious anomaly, the dominant half of the males of a free ranging population were killed by a disease, leaving only the less aggressive, subordinate males. This lead to a marked reduction of violence within the troop, as expected. Unexpectedly, however, this more peaceful situation persisted for many years, long after the initial males were dead.

---

611 Ibid, p. 58. This triad is introduced here, but forms the core argument of the entire book.
612 Ibid. Personally, I would expect the drive for bondedness to exist in any organism which relies on parental care, and the drive for autonomy to exist at the very least in social mammals.
613 Ibid.
614 Ibid, pp. 238, 59-62. This claim is revisited throughout the second half of the book.
and the troop was full of new immigrant males (all juvenile males leave their troop of origin and join another). In other words, a culture of peace was maintained and preserved since that original anomaly.\(^{615}\)

Clark also criticises the apparent obsession of some sociobiologists and evolutionary psychologists with uncovering the biological basis of different behaviour between the sexes in humans. As we have already seen, she points out that biological dimorphism in humans is markedly less than in most other primates, and that the actual emotional and behavioural responses of males and females are much more similar than they are different.\(^ {616}\) She adds that what differences we do see are largely culturally conditioned.\(^ {617}\)

In short, human nature is found in the balancing of bondedness and autonomy, and the meaning systems we create to enable this. We are neither intrinsically hierarchical nor egalitarian (though for most of our evolution we operated predominantly in the latter mode). Our relationships do not primarily derive from conflicting sexual reproduction strategies, but as extensions of our parenting behaviours which, for most of our history, males and females shared pretty equally, and in which all members of successful groups participated. The violence we often witness today is not something intrinsic to our nature, but a result of the disparity between the environments most of us now live in and those of our Pleistocene ancestors, with whom we are still almost genetically identical.

So, we have been birthed by a web of self-interest (not conscious selfishness), and we continue to live within it. Our genes do not directly program our behaviour,\(^ {618}\) but provide us a complex network of behavioural decisions with which to respond to our environment.\(^ {619}\) This behavioural network expresses itself amongst

---

\(^{616}\) Clark, *In Search of Human Nature*, pp. 239-40.

\(^{617}\) Ibid, p. 239.

\(^{618}\) Even Dawkins is adamantly not a genetic determinist when it comes to behaviour (Dawkins, *The Selfish Gene*, p. 3. Especially Dawkins, *The Extended Phenotype*, pp. 11-29.

\(^{619}\) de Waal, *Good Natured*, p. 18.
primates in everything from selfishness and murder to love and sympathy. So we are able to engage in unselfish acts. They are not an illusion, but they are, in some way, derived from our history of self-interest. Our genes’ “self interest” is always to replicate, and they are totally amoral in how they achieve this. At the other end of the cerebral scale, humans are interested in much more than reproduction. We want to feel bonded to others in our community, and to preserve our autonomy within it. We want the balancing of those desires to make sense, to give meaning. We are interested in being successful not only reproductively, but psychologically. This need for meaning exploded with the explosion in size of our brains in the Pleistocene. At least some evolutionary psychologists claim that if we are to retain a sense of meaning, of psychological health, then we need to retain contact with the diverse web of biological interactions in which our brains evolved.

8.2.6 Biophilia - life as Other

We evolved in a web which we found both beautiful and delightful, and ugly and terrifying. Our psychology, our behavioural network, was formed in this web, and therefore perhaps requires this web to keep functioning properly. Edward O. Wilson coined the term biophilia in 1984, and in 1993 he defined it thus,

“Biophilia… is the innately emotional affiliation of human beings to other living organisms. Innate means hereditary and thus part of ultimate human nature… Biophilia is not a single instinct but a complex of learning rules that can be teased apart and analysed individually… from attraction to aversion, from awe to indifference, from peacefulness to fear-driven anxiety.”

I will follow Wilson in including within biophilia feelings like aversion and anxiety, though others call these responses biophobias. Biophilia is a complex,

---

620 Ibid, p. 16.

622 For example, Sagan & Margulis prefer the term prototaxis, the tendency for all organisms to react in distinctive ways to other organisms, which would include biophilia and biophobia (Sagan and Margulis, "God, Gaia and Biophilia," p. 346.) Since all other contributors to The Biophilia Hypothesis follow Wilson’s broader definition, I will do so also.
variable, emotional attachment to life. It is such a complex system because we have evolved in such a complex eco-system, and have such a complex brain to process it. The implication of the biophilia hypothesis is that our psychological health depends on the complexity of our immediate ecosystems, and the depth of our interaction within it. Our ecosystems have been diminished in various ways. We have already considered the net reduction in global biodiversity, which results in local extinctions. It follows that, for humans in a specific area, local extinctions of animals cause an, “extirpation of experience,” making the world a, “poorer, darker, lonelier place.”

This has been exacerbated by the developments of agriculture and domestication, so that most humans now surround themselves with domestic animals rather than wild ones. Associated with this trend has been a shift in human representations of the image(s) of God(s). Amongst nomadic hunter gatherers the spirits or gods were represented by wild animals. As agriculture developed around the Mediterranean coast, with its seasonal approach to ‘nature’, the representation of the gods shifted towards human women, with their regular menstrual cycle. Other groups of humans, who lived in the low fertility interior, survived by herding game over large distances. This separated the men from the women and children, and exposed the men to constant danger, especially to the tempestuous elements. Their image of God evolved into the male God of the storms and skies, and became associated with strong sex based differentiation of labour, itself leading to various gendered hierarchies. When global climate changed and the inland became even more arid, these shepherds increasingly raided the coastal

---

624 Douglas Adams and Mark Carwadine, Last Chance to See (Ballantine, 1992), backmatter. I read this book years ago and could not find a copy again, I found the quote on the Amazon.com book search, which refers to the end of book as “backmatter” rather than by page number.

agricultural lands for survival. Over several centuries they gained control and influence over coastal areas, and their male sky gods replaced the female gods of the seasons. The importation of the patriarchal social structure, and increasing technological developments like irrigation, presumably aided the adoption of the male God as supreme. Figure 5 illustrates this evolution of the image of God.
Figure 5. The evolution of the image(s) of God, based on the text in Baring and Cashford, The Myth of the Goddess: Evolution of an Image.
Many westerners now have no direct contact with livestock at all. If anything, we have pets. Paul Shepard summarises the argument that our pets are enslaved phenotypic freaks. The pet industry marks the end of our respect for the Wild Other. They, along with livestock, become the lens through which we now see wild nature, and the expectations we impose upon it. This leads not only to the diminution of the wild Other, but of ourselves, who evolved in conjunction with Otherness for so long.

“The substitution of a limited number of genetically deformed and phenotypically confusing species for the wild fauna may, through impaired perception, degrade the human capacity for self-knowledge. The loss of metaphorical distance between ourselves and wild animals and the incorporation of domestic animals as slaves in human society alter ourselves and our cosmos.”

Madhav Gadgil speculates that what underlies our apparent biophilia is actually a fascination with manipulating and understanding things, which lead to domestication of crops and animals in the first place. For example, he found that the love and fascination for Indian wildlife that he passed on to his son was quickly replaced by a love and fasciation for computers when they purchased one for the home. He points out that our evolutionary development occurred not only in the context of a diverse ecosystem, but was a story where those who had a fascination for artefacts, and learned to shape and use them (i.e. the technophilic), gained rapid advantage over others. We might conclude from this that humans only need something to be fascinated by, not necessarily animals, for a healthy psychology, but this is of course highly speculative.

---

628 Shepard, “On Animal Friends,” p. 286. When I worked briefly for a vet he lamented the constant health problems faced by pedigree dogs and cats, and pointed out that Chiuwawas are foetuses with a genetic mutation which prevents them maturing, hence the short muzzles, deformed legs and googly eyes. Incidentally, more people are bitten badly enough to require medical attention by Chiuwawas than any other kind of dog.

629 Ibid, p. 298.

Wilson, for one, is sceptical. He points out that we have spent more than 99 percent of human history as hunter gatherers. Our brains evolved in a biocentric, not machine regulated world\textsuperscript{632}. As a consequence,

\begin{quote}
… when human beings remove themselves from the natural environment, the biophilic learning rules are not replaced by modern versions equally well adapted to artefacts… they persist from generation to generation, atrophied and fitfully manifested in the artificial new environments into which technology has catapulted humanity.\textsuperscript{633}
\end{quote}

Yet at least some humans are technophilic, or else I would be handwriting this thesis, or reciting it verbally. Our technophilia has opened up a new world of perception, which emphasises our unity with, rather than difference from, the “Other”. Our microscopes and computers reveal to us the existence of the genes which are the foundation of our bodies, and even many of the mechanisms by which they work. It provides an extraordinarily powerful tool with which to investigate the relationships between species on Earth, and adds weight to Darwin’s shocking claim that humans are, fundamentally, animals.

\section*{8.2.7 Genetics: life as One}

\subsection*{8.2.7.1 The human animal}

*Homo sapiens* is genetically more similar to *H. neanderthalensis* than two subpopulations of modern chimpanzees are to each other, and only slightly less close to *H. erectus*. We were similar enough, genetically, to breed successfully with Neanderthals\textsuperscript{634}. Yet we lump all chimpanzees into one species, and separate the various *Homo* remnants we discover into separate species. Several scientists argue that we should overcome this inconsistency by expanding our definition of the human to include not just ourselves, but our Neanderthal and *Erectus* cousins, as well as *Floresiensis*. Zimmer pushes us to expand the boundary around

\begin{footnotes}

\item[633] Ibid, pp. 31-32.
\item[634] Southwood, *The Story of Life*, p. 231.
\end{footnotes}
“human” even further. The first human beings, he argues, were *H. ergaster*, who appear in the fossil record 1.7 million years ago\(^{635}\). If the following artists’ reconstructions are in any way accurate (figure 6 and figure 7)\(^{636}\), it seems fair to say that, were *H. ergaster* found alive today, they would certainly be considered human\(^{637}\), racism notwithstanding\(^{638}\). Humanity, then, is a less clear category than many people assume it to be.

---

\(^{636}\) Figure 1 is a composite from Tattersall, "Once We Were Not Alone," pp 23-25. Figure 2 is from Zimmer, *Evolution*, p. 267.

\(^{637}\) One commentator has classified *H. ergaster* as monkeys (Finn Jerome Lawson-John, Personal Communication, November 2003.). However, I consider his analysis dubious, since he also identified a photo of ageing male orang-utan as his grandfather, and his own artistic reconstructions of primates leave something to be desired. His marsupials are quite good, however,

\(^{638}\) Australian history teaches us that humans readily deny the humanity of others who look only slightly different. When I visited Uganda in 1998 a number of locals either doubted or outright rejected the humanity of pygmies.
Figure 6. *Homo ergaster, neanderthalensis* and *erectus*

Figure 7. *Homo ergaster*, from Zimmer, which he calls the earliest species to warrant the term human.
Chimpanzees themselves are so genetically similar to us, with almost 99 percent of our gene sequences identical\(^{639}\), that there has been a strong push to reclassify them as part of the genus *Homo*\(^{640}\). Indeed, chimps are more closely related to us than they are to any other primate\(^{641}\), to the extent that it is possible that human/chimp offspring would survive\(^{642}\), but probably be sterile. I follow Zimmer, and draw the boundary around humanity somewhere between *H. ergaster* and chimpanzees, though Bernard Michollet claims that it should be stretched far enough to include Australopithecus\(^{643}\).

Humans do have properties which no other animals do, and *H. sapiens* have properties which differ from other humans. It is, however, universally accepted amongst evolutionists that *H. sapiens* differs from other species by *degree*, rather than possessing any ontological difference. As far as we know, one aspect of our biology is more developed than that of any other creature- our cerebral cortex, and the abilities that gives us. As Mayr says,

“Man [sic] is indeed as unique, as different from all the other animals, as had been traditionally claimed by theologians and philosophers\(^{644}\).”

However, although we are more intelligent than most other animals by, “orders of magnitude,”\(^{645}\) many other animals are not only intelligent, but display emotions such as fear, happiness and depression. Clearly, these things did not suddenly

\(^{642}\) Nick Campbell, email, 17 Feb 2004.; Potts and Short, *Ever since Adam and Eve*, p. 22.

\(^{645}\) Ibid, p. 280.
arrive with *H. sapiens*\(^{646}\). Frans de Waal agrees, based on extensive study of primates and other mammals,

“As a separate species, humans do possess distinct traits, yet the overwhelming majority of our anatomical, physiological, and psychological characteristics are part of an ancient heritage.\(^{647}\)”

“Morality is as firmly grounded in neurobiology as anything else we do or are. Once thought of as purely spiritual matters, honesty, guilt, and the weighing of ethical dilemmas are traceable to specific areas of the brain. It should not surprise us, then, to find animal parallels. The human brain is the product of evolution… it is fundamentally similar to the central nervous system of other mammals.\(^{648}\)”

The expression of culture, long thought to be a distinctively human trait, is almost unanimously identified by primatologists amongst their study subjects. At its most basic, culture (or proto-culture) is defined as,

“…behaviours shared by a population, but not necessarily other species members, that are independent of genetics or ecological factors and that persist past their originators.\(^{649}\)”

According to this definition, culture has even been reported amongst cetaceans (dolphins and whales), and even some birds and fish\(^{650}\). Accompanying this spectrum of expression of culture is a spectrum of consciousness, though it is difficult to say exactly how to measure the latter\(^{651}\). Recent evidence suggests that some dolphin species exhibit some level of self-consciousness\(^{652}\), as may

chimpanzees\textsuperscript{653}. It is even more likely that the now extinct \textit{Homo} and \textit{Australopithecine} species did so, since they are even more closely related to us.

In summary, limiting “human” to \textit{H. sapiens} is a construct, and should be extended at least to encompass other species of \textit{Homo}. The sharp boundary which we drew around humans on the basis of intellect or culture or self awareness is also a construction, an artificial imposition onto a continuum of each of these things which extends from microbes to ourselves. The sciences encourages us to continue this line of inquiry to the point where we question whether there is any such thing as a species in the first place, or whether this itself is yet another artificial construction imposed on a continuum.

8.2.7.2 The species construct

Margulis and Sagan recognise the obvious point that we all \textit{do} have a strong sense of species\textsuperscript{654}, though it is more accurate to say that we all have a strong sense of \textit{relevant species}. Of the thousands of species that an organism encounters, it notices and learn to distinguish between those that are important to it. People who rely on frogs and mushrooms for food, for example, are highly likely to be aware of the subtle clues that distinguish poisonous from edible ones. Jared Diamond provides extensive evidence of this phenomenon amongst hills tribes in New Guinea\textsuperscript{655}. Gary Nabhan and Sara St. Antoine document how quickly such abilities are lost when people are removed from ancestral lands to reservations\textsuperscript{656}.

Diamond demonstrates that the supposedly human-wide phobia of snakes, attested to in Genesis 3:15, is nothing of the sort. Those communities which still eat

\textsuperscript{654} Margulis and Sagan, \textit{Acquiring Genomes}, p. 5.

\textsuperscript{656} Nabhan and St. Antoine, "The Extinction of Experience," p. 241.
snakes have no fear of the non-venomous varieties which constitute a meal. It is only in societies where snakes are no longer eaten, and where it is thus more sensible to simply teach children to be afraid of all of them, that snake phobias exist. I have discovered personally that the same variations exist amongst families. Our house in suburban Oxley backs onto an extensive wetland. Five species of snakes enter our property at different times of year. One of the snakes is potentially deadly, and another quite venomous. The other three are non-venomous and feed on the vermin which attack our crops and chicken eggs. We therefore became very good at identifying snakes and responding accordingly.

Our xenophobic neighbour has the same five species of snake. Since she has no crops or chickens, she perceives no benefit in having pythons and trees snakes in her yard. From her screams it is clear that she identifies all snakes (and even large lizards) as “danger.”

One objection might be raised, that plenty of people are able to identify animals that have no relation to their ability to survive, for example bird and butterfly enthusiasts. This appears to be a modern phenomenon, however, perhaps a side effect of our expanded leisure time which makes it possible to decide to memorise things just for fun, whether birds or trains. Diamond demonstrates that although tribes in New Guinea can identify almost every species of plant and animal on which they depend for survival, they do not distinguish species of butterfly, nor do they have any system of constellations for stars, since they are useless for navigation in jungles.

Margulis and Sagan explain the evolution of the ability and tendency to categorise thus,

---

658 Of course this also reflects our upbringing, but even if I was afraid of snakes as a child, if my life changed so that I needed to be able to distinguish them, I could easily do so.

659 It could also be that these tendencies are another form of peacock feather- a subconscious desire to demonstrate competence in something to impress members of the opposite sex. Or they could be a maladaptation, since those obsessed with train identification tend not to generally impress. I am unaware of any studies of their breeding success.

“…our ancestors needed it to recognise food, potential mates… and many other organisms in order to survive… An instinctive evolutionary cognition of life forms has been crucial to our and other species’ survival (emphasis mine).”

But the ability to distinguish species is readily observed in other animals. Gould accepts that,

“… our brain’s preference for dichotomisation arose as a highly adaptive attribute in a very distant and ancient small-brained ancestor… dichotomisation then persisted throughout the subsequent phylogeny of vertebrates as a historical constraint that became more and more quirky, and more and more limiting, as the brain enlarged into the much more sophisticated instrument of a lineage that eventually generated our exalted, but curiously freighted, selves.”

But he surely puts the development of dichotomisation far too recently in the history of life. Even very simple organisms are able to distinguish light from dark, and warm from cool. Categorisation is fundamental to the very survival of biological life.

When microbes were the only life on the planet, there was no such thing as a species, since they all exchanged DNA with each other. As the gene assemblages of eukaryotic cells become more finely tuned they are less able to integrate new genes, which increases their reproductive isolation. As the phenotypes of these cells diverged, we began to see different “streams” of the evolution of different strategies. Those genes which continued to contribute to successful extended phenotypes continued to be passed from generation to generation, often with other complementary genes. That is the process that continues today; a delta like “river” of genes flowing from the beginning of life. This metaphor is adopted by Dawkins, and by Zimmer, in conjunction with the history of mass extinctions,

“The river of my title is a river of DNA, and it flows through time, not space. It is a river of information, not a river of bones.”

---

661 Margulis and Sagan, Acquiring Genomes, p. 5.

663 Margulis and Sagan, Acquiring Genomes, p. 55.
and tissues: a river of abstract instructions for building bodies, not a river of solid bodies themselves. The information passes through bodies and affects them, but it is not affected by them on its way through.\textsuperscript{664}

“It is an ancient world, in which we are an infant species; a broad river of genes flows around us and through us, its course altered by asteroids and glaciers, by rising mountains and spreading seas.\textsuperscript{665}"

The idea of the continuity, even fluidity amongst species is an old one. Long before the genetic relatedness of all organisms was known, or even Darwin’s \textit{Origin} published, Etienne Saint-Hilaire argued that all animals, vertebrate and invertebrate, came from the one form, so that, “There is, philosophically speaking, only a single animal.\textsuperscript{666}"

Mayr, by contrast, argues that a species \textit{is} a real entity,

“In order to refute erroneous opinions of some philosophers, it must be emphasised that the species is not an invention of taxonomists or philosophers, but that it has a reality in nature. The existence of species is known to the most primitive human tribes...Although a few nominalists still survive, it is now almost unanimously agreed that there are real discontinuities in nature (emphasis mine).\textsuperscript{667}"

When examined closely, however, it is clear that his argument is only that species are a real discontinuity from the point of view of humans and other animals, which are, after all, the focus of his work. Consider a river which branches into a delta. Each tributary is in a sense discontinuous from the others, yet when viewed from above all seen to be part of the same source, and may well merge further downstream, as did the various microbial DNA assemblages that merged to form the eukaryote. Somebody travelling the river may well depend on the ability to distinguish between tributaries in order to survive, someone flying overhead could simply take in the whole scene and wonder at it.

\textsuperscript{664} Dawkins, \textit{River out of Eden}, p. 4.
\textsuperscript{665} Zimmer, \textit{Evolution}, p. 344.
\textsuperscript{666} This was in 1830. Cited in Zimmer, Ibid, p. 29.
\textsuperscript{667} Mayr, \textit{Toward a New Philosophy of Biology: Observations of an Evolutionist}, pp. 315-17.
Dawkins encourages us to look at the river not so much from above as from within. He argues that the breakdown in the concept of species needs to be accompanied by a breakdown in the concept even of the individual body. Despite all appearances to the contrary, bodies are not fundamentally discrete entities at all. This is his *extended phenotype* world view, in which genes affect not only the bodies in which they reside, but extend their influence out into the world around them.

### 8.2.7.3 The extended phenotype

As we have already seen, Dawkins argued that genes are the basic unit of selection. Mayr seemed to agree, but argued that the phenotype of the organism in which the genes reside is the basic *agent* of selection, i.e. that which natural selection acts upon. Dawkins’ extension of Mayr’s view is that the phenotype of a gene is not limited to the organism in which it resides. Dawkins wrote *The Extended Phenotype* for his professional colleagues, hoping to,

> “…free the gene from the individual organism which has been its conceptual prison. The phenotypic effects of a gene are the tools by which it levers itself into the next generation, and these tools may ‘extend’ far outside the body in which the gene sits, even reaching deep into the nervous systems of other organisms.”

> “Fundamentally, what is going on is that replicating molecules ensure their survival by means of phenotypic effects on the world. It is only incidentally true that those phenotypic effects happen to be packaged up into units called individual organisms.”

He restates the second paragraph in a later, more popular work.

---

669 I have already explained what Dawkins means by genes. It must also be remembered that genes are not so much pieces of chromosomes, as *alternative* versions of the same locus on a chromosome. So, in humans three of our genes which relate to blood are labelled A, B, and O. These genes are, for Dawkins, in competition with each other for the same allele, and their survival into the next generation is the fundamental selection event.

671 Ibid, p. 5.
“The individual organism... is not fundamental to life, but something that emerges when genes, which at the beginning of evolution were separate, warring entities, gang together in cooperative groups, as ‘selfish cooperators’. The individual organism is... a secondary, derived phenomenon, cobbled together as a consequence of the actions of fundamentally separate, even warring, agents.”

Dawkins is not introducing a new set of facts into the study of evolution, but rather a different way of seeing facts. He believes that this new way of thinking helps make better sense of many observed phenomena in the world, where individual organisms act in ways which do not appear to be for their own benefit. This, he believes, is because the organism is under the influence of the genes of other organisms, which are manipulating it to their advantage.

One of Dawkins’ examples is the cuckoo, which lays its eggs in the nests of other species of birds, who then feed the cuckoo chicks. There are genes assemblages in cuckoos which make their eggs closely resemble those of other species, and which make females cuckoos lay their eggs in those nests. This is a simple phenotype. Other genes in cuckoos, however, cause baby cuckoos to look and behave in such a way that they manipulate their unwitting foster parents to feed them, even at the expense of raising their own offspring. The behaviour of the foster parents is the extended phenotype of the genes in the cuckoo, and is the result of the indirect manipulation of the host’s nervous system. Dawkins believes that the manipulation of nervous systems through visual displays, sounds, and pheromones is probably far less difficult and dangerous than attempting to physically manipulate other organisms. It is hard to see, for example, how a cuckoo could force other birds to do its child rearing using physical coercion. Insects, however, or rather their genes, excel at the direct manipulation of other organisms because they are small enough to get inside them. We have entered the world of the parasite.

---

672 Dawkins, Unweaving the Rainbow, p. 308.

Dawkins lists some of the hundreds of known case studies of parasites and their influence on both the physiology and behaviour of their hosts. He then argues that a cuckoo’s genes are just as parasitic as those of a liver fluke. This leads to his central theorem, that

“An animal’s behaviour tends to maximise the survival of genes ‘for’ that behaviour, whether or not those genes happen to be in the body of the particular animal performing it (emphasis his).”

This leads to a conceptual web of relationships amongst genes. Some are very intimate relationships, such as two genes on the same chromosome. Other strands stretch much further, across individuals, species, even kingdoms,

“The whole biosphere… is criss-crossed with an intricate network of fields of genetic influence, a web of phenotypic power.” We stand, “in the midst of uncountable interlocking fields of replicator power.”

This is where Dawkins’ work extends that of Margulis and Sagan. Although they remain focused on bodies, they make it clear that what we think of as individual organisms are actually assemblages of numerous organisms, a loose community. I have already used their examples of cows and humans as community assemblages of life forms. They use the words of Clair Fulsome to express their general point, that if somehow all of your human cells could be magically vaporised,

What would remain would be a ghostly image, the skin outlined by a shimmer of bacteria, fungi, round worms, pin worms, and various other microbial inhabitants. The gut would appear as a densely packed tube of anaerobic and aerobic bacteria, yeasts, and other microorganisms… viruses of hundreds of kinds would be visible throughout all tissues. We are… a seething zoo of microbes.

674 Dawkins, The Extended Phenotype, p. 233.
675 Ibid, p. 238.
Dawkins’ point is that we can conceive of a human not simply as an assemblage of organisms, but of overlapping phenotypes which combine to influence our biochemistry and behaviour in a, “web of phenotypic power.” Dawkins is at pains to distance his metaphor of the web from the sort of benign, cooperative system often presented in ecology texts, the sort relied on in the Uniting Church resources,

“A network of relationships there may be, but it is made up of small, self-interested components. Entities that pay the costs of furthering the well being of the ecosystem as a whole will tend to reproduce themselves less successfully than rivals that exploit their public-spirited colleagues, and contribute nothing to the general welfare (emphasis his).”

Genes do still “cooperate” with each other as a byproduct of their own survival. Genes with complimentary effects will tend to prosper in each other’s presence. In other words, the extended phenotype is a blend of the phenotypes expressed by all the genes involved, whether in the same genome, or even same cell, or not. So, genes will often cooperate, but only for their own self interest (to be replicated). The more similar the means of replication of genes at different alleles, the more they are likely to evolve to complement each other. So genes in our nucleus are likely to be very mutually beneficial. This adds another element to the evolution of sex. Sexual reproduction, with its random shuffling of chromosomes, ensures that all genes have an equal chance to end up in the gametes, and thus guard against those genes which might somehow evolve to increase their odds of reproduction at the expense of others in the genome.

Where the genes have contradictory means of replication, say a cuckoo’s genes versus its host’s genes, or viral genes that are injected into our cells, they will evolve in competition with the rest of the host’s genes. The more their extended phenotypes overlap, the sharper the competition will be.

---

678 Dawkins, The Extended Phenotype, p. 236.

679 Dawkins considers this topic, and the possibility of genes circumventing it in considerable detail (Ibid, pp. 133-54).
So, gene assemblages have come together to create phenotypes which aid their replication in competition with the phenotypes of other gene assemblages. These phenotypes include the body, or vehicle, in which they are replicated, but extend beyond it, as if individual bodies were somehow translucent, fuzzy and overlapping, yet able to interact with each other.

When we add the dimension of time we see that, again from the gene’s perspective, the offspring are largely a continuation of the parent, a continuation of their genes into the future. In asexual reproduction they are literally a continuation of the parent. Long before the genetic basis of heritability was understood, Charles Darwin’s grandfather, Erasmus Darwin, argued that,

“Owing to the imperfection of language, the offspring is termed a new animal; but is, in truth, a branch or elongation of the parent, since a part of the embryonic animal is or was a part of the parent, and, therefore, in strict language, cannot be said to be entirely new at the time of its production, and, therefore, it may retain some of the habits of the parent system.”

So the boundaries which we have drawn around humans, around other species, and even around bodies are more fuzzy and fluid than we imagine. The constantly evolving life around and within us looks different depending on where you view it from. If there was a Being able to watch the entire history of life on Earth, and whose survival did not depend on the ability to discriminate amongst species, they may see life very differently than we do. How might such a Being, unlimited by our constraints, see life on Earth? As we explore this question, it will be helpful to create an image of life, however approximate, which tries to bring together the insights from the science story sketched above. We can hold this in our mind as we do our theology. Part of the reason for the persistence of a Genesis inspired view of life is surely the wealth of beautiful iconography which supports it, so we need something equally beautiful with which to break it down.

---

8.2.8 The image of life - Other and One

Gould argues that complex thoughts are best portrayed as images to primates, which led him to his image of the Darwinian stool. Dawkins wrote *Unweaving the Rainbow* to try to unearth good scientific poetry, which could convey complex ideas to a broad audience, and laments that there is not more of it. Most of Dawkins’ examples of bad poetry come from Gould, whilst Gould thinks that the key image of Dawkins’ *Climbing Mount Improbable* is ill-chosen and erroneous. I therefore believe it both important to find an illustration of the phenomenon of life which will convey its main features, and to recognise that no image will please everybody. Indeed, it is a tall order. The image will need to convey many things; the genetic continuity of all life; the splitting of life forms into different species; the principle of symbiogenesis; the existence of mass extinction events; the time scale; and the place of humans in the story of life.

Approaches to illustrating “life” seem to fall into two main categories. The first is to draw the, “web of life,” showing the ecological relationships between a number of species. The second is to draw the, “tree of life,” which shows the historical relationships between evolving species. I will consider the usefulness of each in turn.

The web of life is, as I have said, a ubiquitous metaphor in ecology, both in academic text books and popular media. Often represented literally as a spider’s web, it is occasionally rendered in more detail, of which figure 8 is a typical example,

---

Figure 8. Sketch of the web of interactions of an ecosystem, from an American education web site (http://www.alligatorfur.com/education/web2.jpg), author unknown. The arrows show the flow of a resource from one element to the other. So humans hunt alligators, which eat raccoons, which eat berries, which need sunlight to grow.
There are two problems with these images. Firstly, they are so simple. They imply that each species is more or less a single unit, which interacts with other units. In reality, every individual creature on Earth is linked directly to hundreds or millions of others. Dawkins encourages us to see, superimposed on that web, the billions of billions of links representing the interactions of genes with each other, as our extended phenotypes interact with those of other organisms. This is nearly beyond the imagination, but there it will have to remain as it will never be drawn!

Even this image of a web with billions of interconnections is impoverished and inadequate. It ignores the evolutionary history of life. Life is not a static web, but rather a cross section of an enormously complex flow of life at the particular point in time in which we live. This web changes second to second, as every creature is born and dies. Its dynamism staggers the imagination. Not only that, but since the actions of organisms in the past affect us, and we will affect the future, then the strands of the web, the relationships they signify, also move through this third dimension.

Perhaps we could rescue the web of life as a useful image if we think carefully about which web we mean. We could emphasise spiders, who respin their webs every night. This at least would convey the dynamic nature of the web, though there is no obvious sense of connection between the patterns on subsequent recreations. Further, such webs are usually fairly simple, two dimensional ones.

We might think instead of the web of a golden orb spider like those in Brisbane. Their massive, messy conical tangles haunt disused paths. After the path is cleared with a stick (our mass extinction event), the web flourishes again with a recognizable pattern, yet unpredictable in its details. In the botanical gardens in

---

684 Yes, millions. Remember how many organisms creep upon and within us every day.

685 Although if Peter Jackson could ever be persuaded to direct a film about the stream of life, with the sort of budget he can now command, we might come close.
Entebbe, Uganda, some paths are now impenetrable because of the massive tangle of orb spider webs. If I could find the photo I took of it you would now be looking at the best picture of life I have ever seen.

But few people do think of such webs. Even if they did, all webs are created by the direct action of an external agent, they are not at all self creating, but rather designed, even if only by genetically programmed instinct. Design and external manipulation are, as we have seen, rejected by evolutionists, even though the Uniting Church resources, both anthropocentric and biocentric, imply both.

We should therefore leave the web metaphor behind, except in the very narrow ecological sense for which it was first created, to show that species in an ecosystem interact with each other.

And so to the various renditions of the tree of life, which attempt to convey not ecological, but evolutionary relationships. Whilst nobody has undertaken to represent the whole evolutionary tree in one diagram, there are many illustrations of different aspects of evolution.

Zimmer contrasts a classic, simple evolutionary tree with a modified, mangrove like version which he believes conveys something of the principle of symbiogenesis (figure 9).

---

686 I think the most likely avenue of success is a three dimensional structure on a computer, which reveals as much detail as is known at all points in evolutionary history, and which the user can zoom in and out of and pan around. After a few aborted attempts I have decided to leave such an image to a future enthusiast with more computer and art skills than myself.

Figure 9. A traditional tree of life, and a symbiogenic "mangrove."
Margulis and Sagan’s symbiotic illustration is much more organic. To produce it, however, they sacrifice even the little detail in Zimmer. Their illustration (figure 10) misleadingly implies a single common ancestor for all life, against their text, which claims that life originally existed as a pool of microbes who frequently exchanged genetic material.

---

688 From Margulis and Sagan, *Acquiring Genomes*, p. 34.

689 Ibid, p. 7. In their framework, there is no such thing as a single microbial species (Margulis and Sagan, *Acquiring Genomes*, p. 55.) They claim that two common definitions of species, the biological species concept and cladistic approaches, are “entirely wrongheaded. (p. 7)” They follow the morphological definition, and since microbial morphology is so variable, it is pointless trying to classify groups of microbes into species. Even if one does accept the biological species concept (reproductively isolated populations of individuals) microbes do not qualify as species. Similarly, it is not possible to distinguish them cladistically except in small groups with short histories.
Figure 10. The 'tree of life' from a symbiogenesis perspective. An "individual" animal or species such as a seagull is not the result of genetic mutations through a single line of common ancestors, but is largely the result of the merging of the DNA of several distinct species, and even kingdoms, at various points in evolutionary history.
Both Zimmer and Margulis and Sagan ignore extinction events in their diagrams. The biggest of these events led to the extinction of most life on Earth at the time, so to neglect them in a diagram gives a decidedly false image of the changing shape of the bodies in which genes have been reproducing. The one figure I did find which attempted to convey the presence of extinction events did not do so to scale, nor did it show any other features of evolution (figure 11)\textsuperscript{690}. So, of all the images I looked at, none graphically conveyed the fact that approximately 99.99\% of species which have ever lived are now extinct. None showed the relative proportions of different kingdoms or phyla, for example the fact that the biomass of microbes approximates that of all eukaryotes. None show the time scale accurately\textsuperscript{691}, with microbes taking up almost the entire tree, with a small eukaryotic branch, little twigs for groups like mammals, and a few tiny leaves for the genus Homo. For example, the somewhat useful time line included in the Allan Gardens Digital Collection would be rendered much more helpful if the time axis was linear rather than constantly varying\textsuperscript{692}. It may be that the magnitude of our evolutionary history is simply beyond illustrating at anything like the size of a book page. The American Museum of Natural History, for example, has a \textit{simplified} reconstruction which measures 100 feet long\textsuperscript{693}. A reconstruction which attempted to include every species would need to have between ten million and one hundred million end points\textsuperscript{694}, though less than two million have actually been described so far\textsuperscript{695}.

\textsuperscript{690} Richard Grigg, "Evolution with Extinction Events," (2003), available from http://www.soest.hawaii.edu/oceanography/courses_html/OCN201/Grigg/extinction.html. Used with permission on the condition that I acknowledge that the illustration was intended only as a very rough sketch for a lecture class, and not as a picture of “evolution” as a whole.

\textsuperscript{691} Margulis and Sagan do have an excellent, non logarithmic time-line, which spans ten pages, at the scale of 1 cm = 30my. The time-line is just that, however, not an evolutionary “tree.” (Margulis and Sagan, \textit{What Is Life?}, pp. 55-64.) It is a shame that their time line did not span the entire 200 page book, in which case modern \textit{H. sapiens} would have occupied almost a whole millimetre!

\textsuperscript{695} Margulis and Sagan, \textit{Acquiring Genomes}, p. 52.
Figure 11. Very simplified, conceptual evolutionary tree showing major extinction events. Adapted from annotated version by Grigg for his course, Oceanography 201, taught at the University of Hawaii.
Simple as figure 11 is, I found its stream like appearance highly suggestive. Dawkins and Zimmer have already pointed to its usefulness as a metaphor for the way in which genes flow from one body shape to another. When diagramming life, however, Zimmer reverts to the tree metaphor, albeit a mangrove. The mangrove he constructs, however, does not actually look like any tree found in nature, except those artificially espaliered by humans (external designers) so that their branches fuse. The stream, which non-consciously creates its own channels, is a better model.

The metaphor of a stream also suggests the constraints which have been recognised as shaping evolution. Gould complained that Dawkins’ *Mount Improbable* gives the false impression that environments are static, and life forms need to respond to them as inert “mountains,” whereas in reality life forms shape their environment. In a stream, water does not flow in predefined channels, but creates its own, which then both constrain and positively enhance the direction of flow from then on. These channels are not fixed, but gradually change as a result of the interaction of the properties of the inert substrate and the water which follows.

Despite devoting a book to the idea of evolution as a river, Dawkins does not attempt to produce an actual diagram to convey the concept, and I could not find any other attempt to do so. I began to see why after countless miserable failures of my own. In the end, it was an artist’s manipulation of a photo of a river which best seemed to capture the evolutionary story (figure 12). I slightly modified the picture, raising the top left stream into its current position,

---

696 It was something of a disappointment to discover Dawkins’ book and the quote in Zimmer, since I had by then already “invented” the idea of replacing the tree of life with a stream, failed to draw it, and found the image which I eventually ended up with. The affirmation of knowing that others agree with an idea is a poor substitute for the exhilaration of thinking that one has created a new idea.

698 He *does* have a picture of a forked stream with As, Cs, Ts and Gs floating in it, but it is hardly a picture of evolution, and not strictly representative of his actual idea, in which genes flow through time, not simply a random mess of separate nucleic acids.

illustrative of the eukaryotic stream which separated from the microbial lineage (top right stream). Barely perceptible, somewhere on the left stream, lies the trickle *Homo*, and just barely seeping from its terminus is our species. Less satisfactorily, but still usefully, the same image can be considered to represent the eukaryotic world (or perhaps the multicellular world), with its mass extinctions\textsuperscript{700}.

\textsuperscript{700} This is the opposite of the Necker cube example which Dawkins uses. In this case, different realities are revealed in the same image.
Figure 12. Photo of a river retouched by an anonymous artist, and further modified by myself. It is the best illustration of some of the major features of evolution mentioned in this thesis; some tributaries rejoin (following Margulis & Sagan); only a small fraction of life that has existed persists in the present (top of diagram); the termination of some tributaries is associated with rapid expansion in others, as in mass extinction events; microbial life (the centre stream) generates the tributaries, and remains a significant force throughout time.
How do we combine the evolutionary stream of life with the ecological web? Here we move into three dimensional space, something which we do not all do equally well. Imagine that the stream, rather than flowing across a two dimensional plane, is free to flow in three dimensions, like veins in a leg. Now take a cross section of the stream (imagine amputating the leg). You will see a mass of tributaries. Each one represents a line of evolutionary development which most people call a species. Now imagine drawing a fine line between each pair of species that have some sort of ecological relationship to each other. This is the simplified web of life, the cross section of the evolutionary stream at any point in time. As we move through time we see the web expand and contract, reshuffle its threads, being torn asunder and reforming. Evolution, in other words, moves us away from the illusion of a static, harmonious, designed web and shows us its dynamic and unpredictable nature. To see life we need to hold the web and the stream together. We end up with a three dimensional, pulsing, flow of life\textsuperscript{701}.

8.2.9 The rest of the image of life: Earth’s four billion year future

Now we take the final step in imaging life on Earth, one which evolutionists often seem to underemphasise. As we shall see, it shakes the theological foundations. The mind numbingly amazing story of life on Earth is far from finished. All of the above diagrams subtly feed into our assumption that we are at the end point of evolution. In living memory not much seems to have changed, biologically. The consensus is, however, that Earth will exist for another seven billion years or so\textsuperscript{702}. We need to double the size of the flow of life, to look over our shoulder as it were, and watch it meander through another seven billion or so years of life. When I presented this section of the thesis at the Christianity after Darwin conference, I asked the audience to close their eyes as I attempted to construct this mental picture for them. Unfortunately, you will need to keep yours open,

\textsuperscript{701} Pulsing represents the punctuated nature of evolutionary change.

Can you see this twisting, three dimensional stream, a network of trillions of channels, flowing through history towards us? Watch it rush through three billion years of life. Sometimes it nearly dries out, then it bursts forth in new patterns. It starts as a rumbling at the horizon, rushing forwards until it is about to bowl us over, as if we were standing on a desert with a wall of water rushing towards us, carving out millions of billions of trillions of channels as it goes.

Good.

Because now you need to look over your shoulder. Watch as this incredible powerhouse races off into the distance. Not far behind us the links which represent *H. sapiens* either dry up, or split off in new directions. The whole raging torrent continues on over the horizon, sometimes full, sometimes nearly empty, before finally drying up for good when the sun envelops Earth.

We have just seen the best snapshot of the whole of life I can imagine. We have just seen the image of God\textsuperscript{703}.

We need two calendar years for Mayr’s chart of life on Earth. We need two people with arms outstretched to convey Dawkins’ image, with humanity a fleck of dust between their fingertips. We need to redraw all of the evolutionary trees, but we do not know what the second half should look like! Will a nuclear war, or comet strike, wipe out all vertebrates\textsuperscript{704}? Perhaps the reptiles will get a chance to

\begin{flushright}
\textsuperscript{703} Jason John, "Biocentric Theology and the Image of God" (paper presented at the Christianity After Darwin: Doing Theology in an Evolutionary Context, Adelaide, Australia, September 2004).

\textsuperscript{704} Ward & Brownlee (Ward and Brownlee, *The Life and Death of Planet Earth : How the New Science of Astrobiology Charts the Ultimate Fate of Our World*, pp. 167-74.) offer a dramatic
reclaim the world from their mammalian usurpers. Birds, whose brains are organised quite differently from ours, could evolve a very different, yet highly complex, level of intelligence\textsuperscript{705}. It may take decades, or millions of years for \textit{H. sapiens} to cease to exist on Earth, but the biological record tells us that it is inevitable\textsuperscript{706}.

Whatever mass extinction events may occur, scientists are now fairly confident that they can foretell Earth’s future, at least in broad brush strokes. If God is indeed guiding evolution, it is sobering to consider where it is being guided to. According to Peter Ward and Donald Brownlee, we live at approximately the mid-point of life on Earth, as I said above. We also, however, live at the mid-point of \textit{animals} (figure 13)\textsuperscript{707}.

\textsuperscript{706} Gould reminds us that the common perception that we have halted human evolution through our technology and cultural developments is false. We know that evolution is a process of stability punctuated by rapid developments, so we would expect human genetic makeup to remain stable for periods of tens of thousands of years at a time (Gould, \textit{The Structure of Evolutionary Theory}, p. 78.)

\textsuperscript{707} Ward and Brownlee, \textit{The Life and Death of Planet Earth : How the New Science of Astrobiology Charts the Ultimate Fate of Our World}, p. 106.
Figure 13. Figure from Ward & Brownlee, showing the short span of Earth history over which animals will exist in any significant numbers. Life will not go on gaining in complexity until the end of Earth, but will soon begin to become increasingly simplified, as oxygen hungry nervous systems become increasingly selected against.
Life will not continue to get more and more complex until the Sun finally consumes Earth. In a mere 500 million years all of the complex plants we now know will be extinct, killed off by plummeting CO$_2$ levels\textsuperscript{708}. Grasses, algae and mosses will remain. Animals may then rapidly perish, but it is probable that they will linger for another 100 to 200 million years\textsuperscript{709}. When I say animals, I do not mean humans, vertebrates, or indeed anything with much of a brain. In the minimal oxygen atmosphere, brains and nervous systems will be unsupportable, “…and the world will evolve into ever greater stupidity, with less complex sensory organs and behaviour.”\textsuperscript{710} Truly the meek will inherit the Earth.

Eventually, as global temperatures reach 50°C there will be wholesale extinctions of even the insects on land. At 60°C only bacteria, algae and fungi will survive, and at 70°C bacteria will have the planet’s surface to themselves\textsuperscript{711}. Organisms in the ocean might survive a little longer than their terrestrial cousins, down in the cooler depths, but increasing global temperatures mean accelerated evaporation, and eventually Earth will be entirely without water, experiencing surface temperatures possibly as high as 1000°C.

So, the flow of life featured above is only half the story, we must add to it an equivalent length of flow, which might continue to diversify for a time. However, in the not too distant future, it will be reduced to a series of trickles, with the animal trickle comprised almost entirely of invertebrates. What we do know is that human beings will not be there at the end. I therefore offer my final attempt at the diagram of life on Earth in figure 14.

\textsuperscript{708} Ibid, p. 108.

\textsuperscript{709} Ibid, p. 124.

\textsuperscript{710} Ibid, p. 125.

\textsuperscript{711} Ibid, p. 128. This is mean global temperature. Once the mean temperature reaches just 38°C the equator will already be practically lifeless.
Figure 14. The tributaries showing a possible full history of life on Earth, including the impending extinction of complex plants and animals, following the scenarios described by Ward & Brownlee.
8.2.10 The rest of the image of life: spread throughout the universe

Finally, we must remember that the image of life is probably, or at least possibly, not confined to Earth. It may extend back billions of light years before the image emerged on Earth, and continue for trillions of years after Earth is vaporised, before the universe finally becomes uninhabitable. So humans are a speck of the image of life on Earth, which may itself be a speck of the image of life in the Universe.

8.3 Summary

Humans are a flash in the history of the universe, a history with a much, much longer future than a past. If, as is likely, there is life elsewhere, then the universe story is played out over a stage which is orders of orders of orders of magnitude larger than the sphere of human activity, and we will almost certainly never see any of it.

Even on Earth, the human story is a tiny part of the story of life, and the H. sapiens story is even briefer still- 0.002 of one percent of it. We arrived at 11:56:30 in the first year of Earth’s life. Earth has about another year to live, but H. sapiens will only be present for a few hours at the outside, a couple of days at the very most.

The driving force behind this story is the evolution of genetic material which has replicated itself in a dazzling array of life forms, using a bizarre concoction of strategies. The interaction between the genes and the environment of these life forms, lately modified by the conscious decisions of some more cerebral forms, made life as we see it today. There is constant interplay between the unit of selection (the gene), and the target of selection. Many believe that the individual organism is the target of selection, but Dawkins argues convincingly that phenotypes extend beyond individual organisms in a network, or web, of interactions.

\footnote{Page 42.}
While natural selection of random variation amongst individuals is the driving force of evolution, this is constrained and complemented by a variety of other factors. As certain body plans become more complex, the number of simultaneous mutations required to change them successfully escalates, and so therefore does the probability of them being conserved. Symbiogenesis provides an alternative pathway for the accumulation of new genetic material in organisms. Random events also have a significant influence on which organisms survive into the next generation, from the individual level to the mass extinction events which repeatedly occur on Earth. Mass extinctions are just one phenomenon which assures that evolution does not occur at a constant rate, but in punctuations.

There is no evidence that evolution has been guided by any external force or intelligence, God included. Whilst there are certain trends within certain lines of evolutionary development, there is no evidence of an overall direction, and in the near future all trends towards complexity will reverse, first in plants and then animals. It is also meaningless to talk of any organism as being better, or more advanced than others, there are simply different ways of surviving in a highly diverse environment. It is true that if we look within very discrete lines, we can talk of development of certain qualities. For example, within the line *Homo* the very limited fossil evidence implies an increase in bipedalism, language and “culture.” Interestingly, brain size has not steadily increased- Cro Magnon people had larger brains than modern humans\textsuperscript{713}, as did Neanderthals\textsuperscript{714}.

Every aspect of *H. sapiens* which has been held up as evidence of human uniqueness has been demonstrated to be a difference of degree, not ontology.

Our genesis was made possible only by an extraordinarily long, highly contingent process, involving an enormous amount of both pain and pleasure in billions of

\footnotesize
\textsuperscript{713} Jim Foley, *Fossil Hominids: Cro-Magnon Man* (11 November 2004 c2004 [accessed November 2004]). Cro-Magnon people are not a separate species, they are one of the “ancient *Homo sapiens*”

organisms, underwritten by the non-conscious and nonmoral genes which code for our construction. Our biological form is the result of “blind, pitiless indifference.”

But this indifference is not the only source of who we are, as illustrated in the story of the evolution of sex. The first sexual encounters were not even encounters, as non-conscious organisms cast their gametes to the water or wind. The latest practitioners experience the same basic event as an often extremely pleasurable pastime, which bonds small primate communities together so effectively. Life “uses” sex to combat parasitism. But many organisms use sex for pleasure, especially *Pan bonobos*[^715], *H. sapiens* and dolphins[^716]. Out of pragmatic genetics has emerged emotion, double edged sword that it is.

Life on Earth has survived a number of cataclysms which reduced it to a trickle, and without which we would not exist. Even so, the human mediated loss of biodiversity is probably unique; the largest in total magnitude though not percentages, and initiated by a single, partially rational species. Nevertheless, the life forms which have most shaped the biosphere as we see it today are the microbes. Relative to them, the impact of *H. sapiens* is minimal.

Even without mass extinctions, death and pain are constitutive of the web of life. This web of ecological relationships is far less benign than many environmentalists, in and outside the church, imply. It is neither delicate, nor static, nor intrinsically cooperative. The participants in the web of life overwhelmingly interact unconsciously and amorally, and so therefore is the web itself. Pain is an essential warning mechanism to protect us from the environment and other organisms which try to exploit us. Individual deaths are essential to

make way for new lives, just as extinctions are a prerequisite for the emergence of new species.

Yet from this amoral system has evolved consciously moral creatures, certainly within the primate line. Morality has not entered the world as an external “spiritual” force helping us to overcome our beastly, evolved natures. It evolved from the very same processes responsible for our biological evolution. Morality probably evolved to provide meaning systems within which the need for bondedness and autonomy could be met within small social groups, and therefore possibly exists amongst cetaceans also. As expected, morality itself evolves in response to changes in the environment, and some systems of morality, or the communities who bear them, go extinct in the face of competing systems of meaning.

As humans developed agriculture and technology they began an extremely rapid journey away from the environment of the Pleistocene in which our brains and emotional hard-wiring evolved. A plethora of meaning systems resulted, but there is a general trend away from using animals, the Wild Other, to depict the gods. Agricultural societies generally moved towards female fertility gods, which related to the changing seasons. In the antecedents of the Judeo-Christian-Islamic religions they were in turn replaced by the gods of the horse riding tribes, whose theology was shaped by exposure to the elements on long, dangerous journeys, separating them from the women and children. This theological evolution, as told by the social scientists, is, like biological evolution, is not a story of progress or improvement, but of adaptation to a changing environment.

If anything, it may be a retrograde step, since it reflects the beginning of what has now become the extreme isolation of many humans from the rest of life around us, especially non domesticated life. Our Pleistocene adapted, biophilic psychological core seems to be suffering from this increasing separation from the Wild Other. A symptom, and partial remedy, may be our increasing fascination with technological objects.
So on the one hand we are being encouraged to re-engage with the Wild Other for our well being. On the other hand, technology is allowing us to see that “Other” is a constructed meaning system. Although this construction is essential for the survival of biological organisms, it is superimposed over a fundamentally continuous, pulsing stream of life (or genes, body plans, emotions, language, morality, or any other quality we care to mention). The best overarching image of life is a three dimensional pulsing flow, spanning some seven billion years on Earth.

Christian theology claims that this pulsing flow of life is in some way a creation of God, who is a non biological person. God, then, may see life, relate to life, free of the meaning system we have had to impose upon it to survive. If God is creator of life, then life should tell us something about God. The image of life presented here, and the sort of relationship it implies between God and creation differs markedly from that presented in Genesis. Since Christian theology has traditionally grounded itself in Genesis, we might expect to conclude quite different things about God and ourselves in light of the above story, and the image of life it leaves us.

We will see that the scientific stories have an impact upon all three of the propositions in the anthropocentric theology found within the Uniting Church, as I intuitively expected. That is, the notion that humans alone are created in the image of God, charged with some form of dominion over the rest of life, and responsible for the fall of the whole of creation into something less than it was created as. Surprisingly, to me at least, was that the science stories also called into question the more biocentric elements found in the Uniting Church resources, and much of the wider ecotheology movement which they reflected. I will now survey how theologians have responded to these challenges, before moving on to propose a biocentric framework which is, I believe, more consonant with the information we have from the life sciences.
9 Theological evaluation

9.1 *H. sapiens* as the image of God

9.1.1 Summary of the scientific data

We have seen that there is no biological property of *H. sapiens* which is ontologically distinct from other animals. While the relatively massive and well developed human brain has enabled the emergence of intelligence, emotion and culture, even these things are possessed in other animals to different degrees.

We have also seen that the images which humans use to represent the gods have themselves evolved over millennia, with the representation of the gods as animals giving way to the image of the goddess, which itself was recently almost entirely replaced by the image of the male God in those religions rooted in Judaism.

9.1.2 Theological responses

What the author(s) of Genesis 1 meant by the image of God has been extensively debated by biblical scholars and theologians, as comprehensively reviewed by Claus Westermann. He makes the interesting point that although the literature on this topic is nearly limitless, it is not a major preoccupation of the biblical witnesses themselves, being mentioned again only in Psalm 8.

By far the most common interpretation is that the image of God consists in some sort of quality or capacity, for example, “personality, understanding, the will and its freedom, self-consciousness, intelligence, spiritual being, spiritual superiority, or the immortality of the soul.”

---

719 Ibid, p. 149.
Pope John Paul II follows Aquinas in locating the image of God in human speculative intellect\footnote{Pope John Paul II, \textit{On Evolution}.}, which is evidence of the unique nature of the human soul. Protestant theologians also looked to biological and intellectual properties of humans as evidence of the image of God. Karl Barth, who had a major influence within Protestantism\footnote{(H. Paul Santmire, "Healing the Protestant Mind: Beyond the Theology of Human Dominion," in \textit{After Nature's Revolt : Eco-Justice and Theology}, ed. Dieter T. Hessel (Minneapolis: Fortress Press, 1992), p. 66.}, believed that culture was a, “particular human activity."\footnote{Karl Barth, "The Humanity of God," in \textit{The Humanity of God} (Richmond: John Knox Press, 1960), p. 54.} This undergirded his claim that,

\begin{quote}
"Man [sic]… is elected… as the being specially endowed by God. This is manifest in his special bodily nature, in which he of course has ever so much in common with plant and animal, and also in the fact that he is a rationally thinking, willing and speaking being destined for responsible and spontaneous decision (emphasis mine)."\footnote{Ibid, p. 53.}
\end{quote}

Mark Brett represents a different line of interpretation. He points out that the symbol, \textit{image of God} was already in use when Genesis was compiled, and referred to the functional authority of kings to rule in the place of the gods. It was they alone who were bearers of the image of God. Genesis, he claims, uses the symbol as a democratising protest against the prevailing culture, subverting the use of the symbol to claim that \textit{all people} are bearers of the image\footnote{Mark Brett, "Earthling the Human in Genesis 1-3," in \textit{The Earth Story in Genesis}, ed. Norman C. Habel and Shirley Wurst (Sheffield: Sheffield Academic Press, 2000), p. 96.}.

Theodore Hiebert also focuses on the pre-existing use of the symbol, and also claims that the image of God was used to say something about the function, not ontology of humans\footnote{Theodore Hiebert, "The Human Vocation: Origins and Transformations in Christian Traditions..," in \textit{Christianity and Ecology : Seeking the Well-Being of Earth and Humans}, ed. Dieter T. Hessel and Rosemary Radford Ruether (Cambridge, Mass: Harvard Univ Pr, 2000), p. 138.}. Far from being used as a democratising influence, however, Hiebert sees the symbol being adopted by the priests responsible for this part of Genesis to legitimate their own position in Israelite society. All people...
were to the animals as the priests were to all people: the divinely appointed rulers\textsuperscript{726}.

Westermann himself disputes both the functional and ‘spiritual quality’ interpretations. He agrees with those who say that the image of God is not about what humans are, or how they relate to the other animals\textsuperscript{727}. The image of God, he believes, was intended to say something about the relationship between humans and God. According to the priestly redactors of Genesis, humans were created for relationship with God, they are enough like God to be able to respond to God\textsuperscript{728}.

Despite all the differences in these interpretations and the many others Westermann lists, the unanimous assumption is that the image of God is to be found solely in human beings, and constitutes an ontological gap between humans and other animals\textsuperscript{729}. Whether it is a characteristic, a functional role, or the ability to relate to God, the assumption is that only humans have it or can do it.

Let us return to the majority interpretation, that the image relates to a human characteristic. How do theologians respond to the insights of evolutionary biology, which demonstrates that the human characteristics most commonly used as evidence that we alone possess the image of God, are not ontologically unique to humans?

The official Catholic response to scientific speculation about human nature is, as we have seen, to claim privilege for the magisterium, and the revelation from God that humans are ontologically different, irrespective of anything science may

\textsuperscript{726} Ibid.

\textsuperscript{727} The passage which refers to the image of God probably initially was an independent piece, only taking its place after the creation of animals much later (Westermann, \textit{Genesis 1-11: A Commentary}, pp. 156-57.

\textsuperscript{728} Ibid, pp. 156-58.

\textsuperscript{729} Ibid, pp. 157-58.
claim. The difference is due to the unique human soul, which originates external to biology, being somehow imparted directly from God.\textsuperscript{730}

The position is well summarised by Michael Schmaus in his 	extit{Dogma 2: God in Creation}, “… there is between man [sic] and the rest of creation a fundamental and irreducible distance (emphasis mine).\textsuperscript{731}” He acknowledged that most Catholic theologians of his day (1969) accepted a moderate doctrine of evolution, but was adamant that for Catholics, “… although the human body and psyche arise out of the continuous process of evolution, the human spirit does not; the human spirit… originated as a new principle of being and activity.\textsuperscript{732}”

Catholic theologians, then, are bound to reject the implications of science on this point. Edwards, for example, simply states that although the cosmology of Genesis 1-3 is not binding on modern Christians, its theological insights are, including the insight that humans are created in the image of God.\textsuperscript{733}

Edwards reveals that a number of Catholic theologians, including Karl Rahner, share his discomfort with the idea that God intervenes in history to implant the human soul either in the human species, or in individual people.\textsuperscript{734} Nonetheless, he affirms the radical distinction between humans and other animals in a way which can only be considered ontological,

\begin{quote}
“It is this one divine act that enables what is radically new to emerge in creation. Above all it enables the emergence of self conscious and spiritual human beings. Each of them is created in radical uniqueness in the image of God… Each of them is destined for eternal life… Are there other such creatures in the universe? - Theology can’t say yet.”\textsuperscript{735}
\end{quote}

\textsuperscript{731} Ibid, p. 111.

\textsuperscript{732} Ibid, p. 125.

\textsuperscript{733} Edwards, 	extit{The God of Evolution: A Trinitarian Theology}, p. 11.

\textsuperscript{734} Ibid, p. 75.

\textsuperscript{735} Ibid.
By remaining silent on the possibility of other creatures in the universe being like us, Edwards holds open the possibility that the image of God may be broader than we conceive it to be, but he clearly does not see any other signs of the image here on Earth. This is a position which he reiterated in a recent theology-science dialogue, and in a more fully developed paper in the same year.

The Roman Catholic dialogue with science on this point, then, is impossible. The same is true of the Orthodox Churches whose theology, for similar reasons, “… starts and ends by placing human beings at the centre,” claiming that we are the centre and height of God’s creation.

Similar sentiments dominate Protestantism, though for different reasons. Thomas Torrance, an influential Protestant thinker who has written on science and theology, is a contemporary example,

“From the perspective of theology man is clearly made the focal point in the interrelations between God and the universe. He is given a special place within the creation with a ruling and priestly function to perform toward the rest of created reality. All lines of rationality and order… depend on his destiny (emphasis mine).

“The fact that God has taken the way of becoming man… immensely reinforces the unique place of man in the universe.”

Although his conclusions are very similar to the Catholic position, Torrance does not elaborate an ontological defence. For him it is enough that God became a human being. Although Torrance values the dialogue between science and

---

theology, it is probably not his primary focus. Of his many books, only a few, and those predominantly early in his career, deal primarily with science. These tackle cosmology more than evolutionary biology, so his views on humankind’s ontological distinctiveness is not directly challenged by his dialogue. According to Polkinghorne, Torrance is one of those theologians who pay, “…some attention to science in their writings (emphasis mine),” which may have something to do with his enthusiasm for Karl Barth.

Barth determinedly avoided all scientific questions, claiming that they had nothing to do with the theological problem of creation, although he did admit that science may yet make discoveries important for theology. For Barth, it was important to engage with Genesis as a saga, in the light of Christ, not science, and so he avoided dealing with the natural sciences on principle. For Barth, although theology is the, “science and doctrine of God,” Christian theology is really, “The-anthropology,” a doctrine of God and man. The evangelical theology he championed was, “…the science and doctrine of the commerce and communion between God and man [sic], informed by the gospel of Jesus Christ as heard in Holy Scripture (emphasis mine).

---

742 Polkinghorne, *Scientists as Theologians*, p. ix. In this list he includes Hefner, Moltmann, Murphey, Pannenberg and Peters.

745 Ibid.

748 Ibid.

749 Ibid.
Barth’s refusal to engage with science was a reaction against what he saw as an unhealthy preoccupation with that very engagement by his predecessors. This is unfortunate, since Barth opposed those who, in his view, made humans the measure of all things. But by limiting theology to the discussion of God and humans, he missed one of the most powerful tools for relativising the position and importance of the human - i.e. evolutionary biology. Protestant theology should be open to this relativising because it generally rejects the body/soul dualism which the Catholic position rests on, having offered a sustained critique of it for decades. Indeed, Protestant theology has always tended to have a more generationist view of the soul, in which the soul is simply a, “dimension of the material world.”

If the soul is entirely a dimension of the material world, then Protestant theology has no recourse to an ontologically different soul upon which to hang the image of God. We must continue the dialogue on this most crucial issue, to see whether theology can reconceive of the image of God in a way which is consonant with the scientists’ conclusions. One approach could be to simply to do away with the concept of the image of God.

9.1.2.1 There is no image of God

It has been assumed for most of Christian history that since God designed or created Earth and life on it, we could see something of God by looking at ‘nature’. Since the science story finds no evidence of external guidance shaping the development of life, we could conclude that life is no image of God at all. This could be consistent with the Orthodox tradition, for example, which emphasises

---

750 Ibid.

752 Dutney, Ensoulment.
the inscrutability of God\textsuperscript{753}, and in the Protestant tradition, many theologians admit that the universe is at least partly independent of God\textsuperscript{754}. To the extent to which the latter is true, we could say that the universe, or life, is not the image of God. This would also be true of us, to the extent that evolution, rather than God, is responsible for our biology and soul.

The “image of God” symbol could be retained for Christ, who is the image of what the divine/human nexus looks like. In other words, he is the image of God for \textit{we humans}, but not the image of God \textit{in toto}.

However, as we have seen, being in the likeness of God is only part of what it means to be in God’s image. The image of God is primarily a claim that its bearer is able to be in \textit{relationship} with God, and secondarily is therefore enough like God to have a relationship. To declare that there is no image of God, then, is to declare that there is no relationship with God. If this were true, there would be nothing left to say, and no Christianity.

For now, then, I retain the idea that there \textit{is} an image of God, a relationship with God, but reject the idea that this can be constrained to human beings alone, since there is no ontological distinction between them and other organisms. How might we go about broadening the image of God?

First we must ask whether Christians \textit{can} broaden the image of God. Since it is such a central image in Christian theology, will theology still be Christian if it changes it substantially? This question was first addressed decades ago in the Christian feminism movement, and the reactions to it. I will consider it by briefly reviewing the impact of feminism on another central Christian claim about God, that God is Trinity. Feminism must be able to talk of God as Trinity if it is to claim a place within Christianity, as must biocentric theology. But it must be able to talk about Trinity in a way which is consonant with feminism. In other words,

\textsuperscript{754} Torrance, \textit{Divine and Contingent Order}, pp. 71-72.
feminist Christians had to demonstrate that the traditional Christian formulation, Father, Son and Holy Spirit, is not the only possible formulation for the Trinity.

9.1.2.2 From an androcentric to anthropocentric image

I have already mentioned that the image of God used to be confined to men alone in Christian tradition. Gradually, it was acknowledged that women, too, were bearers of the image, though often in a different sense. Yet the language used to describe God, in official theological texts and weekly worship, remained thoroughly androcentric, and God as Trinity meant exclusively God as Father, Son and Holy Spirit.

In reaction, some early feminists, especially ecofeminists, simply rejected the male God, and transferred their allegiance to the goddess. Rosemary Radford Ruether, however, argues that this is inadequate since it merely replaces one distortion with another. Rather, our images of God must embrace both male and female if they are to be theologically adequate,

“Because how we image God is precisely the revelation of God that we access, expanding our image to honour the equality of women in the image of God by imagining female metaphors of God is more than a matter of forced correctness. It is a symbol and symptom of a collective work of metanoia.”

But is this metanoia possible in the Uniting Church? In its opening section of the Basis, the uniting denominations declare of their union that, “They pray that this act may be to the glory of God the Father, the Son and the Holy Spirit (emphasis mine).” This masculine Trinitarian formulation repeats throughout the Basis, and

Ruether has a useful survey of this history, from the original Genesis passage, through Catholicism to Barth (Rosemary Radford Ruether, “Imago Dei, Christian Tradition and Feminist Hermeneutics,” in Image of God and Gender Models: Gender Models in Judaeo-Christian Tradition, ed. Kari Borresen (Minneapolis: Fortress, 1995.).)

places it squarely within the majority tradition of the church since formalised at the first council of Constantinople in 381.\footnote{758}

Uniting Church members cover the spectrum from ecofeminists calling for inclusive language for the image of God\footnote{759}, to those who see the traditional masculine labels as the only labels. When working in a local congregation I surveyed the members’ attitude to calling God “She” in worship. The women’s responses ranged from enthusiastic acceptance to threats to leave the church if that happened\footnote{760}. Female language about God has been enthusiastically adopted in some congregations, including the Mustard Bush faith community\footnote{761}, the explicitly pro-feminist Fitzroy Uniting congregation\footnote{762}, and the Murray Bridge late morning service\footnote{763}, but they are a tiny minority in the Uniting Church.

Amongst ministers and scholars in the Uniting Church a similar disagreement exists. Drasko Dizdar, when a final year ministry candidate, spoke of the Trinity as God beyond-all, God-with-us, and God-within-all\footnote{764}, and avoided using the male pronoun for God. Stephen Reid argues that,

“The use of ‘Father’, ‘Son’ and ‘Spirit’ as language for talking about God is clearly a metaphorical use of these terms. Whether there is a primary literal use is a matter debated by some

\footnote{758}{Although the phrase, “Father, Son and Holy Spirit” is found in Matthew 28:19, “Scripture is like a broad stream with many currents. Not every current leads to Nicea and Chalcedon…”(Chris Mostert, "The Place of the Bible in Preparing and Receiving Doctrinal Statements," Trinity Occasional Papers 1, no. 1 (1981): p. 23.) Although the Trinitarian formula was in frequent use by the beginning of the second century, for example by Clement and Ignatius, the coequal divine Trinity does not become binding orthodoxy until Constantinople. For a very brief summary see Edwards, The God of Evolution: A Trinitarian Theology, p. 78.}

Using Lindbeck’s cultural-linguistic approach to the study of religion, Reid argues that the theological rule laid down in the *Basis* is that God must be understood in Trinitarian terms. The labels for those terms are secondary and malleable. In response to feminist concerns about the patriarchal and kyriocentric implications of “Father, Son and Holy Spirit,” the labels ought to be, or at least can be, changed to better represent Trinity to a modern community.

In contrast, Rosalie Hudson argues that feminist-inspired images of God are similes, whereas God as “Father, Son and Holy Spirit” is a revelation from God and is the way that the Trinity is to be described. She quotes with approval *One God One Lord One Spirit*,

> “Christian belief in the fatherhood of God was never intended to imply that God is male… As a human being, Jesus is male. But within the persons of the Trinity, there is no gender.”

What Hudson does not address is that for Christians today, if not for Christians of all times, calling God Father and Son does imply that God is male. Whether it was meant to or not, calling God by exclusively male pronouns made Christians think of, and relate to, God as male. Whatever the validity of her rejection of new names for God on the grounds of inclusive language, Hudson ignores the far more important argument that our language about God must communicate as best it can who God is. Continuing to speak of God using exclusively male pronouns in the twenty-first century absolutely fails to do that, and miscommunicates the nature of God to most hearers.

---

766 Lindbeck, *The Nature of Doctrine*.

The issue of Trinity Occasional Papers that Hudson’s article appears in contains a number of other papers presented to the Commission on Doctrines and Liturgy in 1989. One of them, by Arthur Jackson, focuses on the charismatic experience but, in passing, offers some reflections on names for God. He begins by acknowledging that, “Anyone who cannot see the point of trying to devise inclusive language must be very insensitive.” He correctly rejects, “Creator, Son and Holy Spirit” as an alternative, pointing out that in the biblical witnesses the Son and Spirit are also involved in the process of creation. He also points out the inconsistency of retaining Father but calling the Spirit “She”, since although ruach is feminine, pneuma is neuter, and it is this on which Trinitarian theology is based in the New Testament. I would add that speaking of one member of the Trinity as male and another as female actually increases the gendered nature of the Trinity rather than decreasing it.

Jackson would be happy to call God Mother in some new prayers and Father in traditional ones, even though he finds it,

“…hard to call God ‘Mother’- perhaps the result of being 70 years old. Teaching old dogs new tricks is easier than teaching old Christians new prayers.”

What is most important for him is what Reid might see as another “rule” to lay alongside the rule of God as Trinity: There is an intimacy within the Trinity which must be preserved by language about God. So Jesus’ cry to God as Abba reveals an intimacy that must be preserved. For this reason Jackson believes that Abba language must be retained, but can be supplemented. We should not replace Father with Parent, as no child calls their parent, “parent”, and so the relational warmth implied by the metaphor is lost. Rather, God is best referred to as Father.

---

772 Jackson, "Charismatic Worship: Trinitarian Theology," pp. 32-33. Here Jackson has Moltmann especially in view.

773 Ibid.
and Mother, though for a younger generation perhaps mum and dad is better at preserving the intimacy Jackson desires.

In the same issue of Trinity Occasional Papers is a one page summary of a paper by Pat Baker\(^ {774} \). The editor explains that space precluded all the papers being included, but does not explain why the feminist article is therefore reduced to one page, whilst the conservative nine page article by Hudson is reproduced in full. The editor tells us that Baker describes herself as “… a feminist Christian with a case to put in what is probably a no-win situation,” who seemed to believe that the commissions were unlikely to agree with her attempts to reformulate the Trinity, since, “… arguing against the traditional Trinitarian formula in a group like this is like attacking motherhood and parliamentary democracy.” According to the summary, Baker believes that all images used in the names and descriptions of God are metaphors, and that church tradition is “fraught with examples of the failure to remember what metaphor is.”

The alternative formulations she suggests for the metaphor of Trinity are:

Creator, Redeemer, Sustainer  
Source of all being, Eternal Word, Holy Spirit  
Maker, Keeper, Lover  
Creator, Liberator, Comforter  
Creator, Christ, Holy Spirit  
God who made us, God who saves us, God who keeps us all

Lover, Beloved, Love  
Abba, Servant, Paraclete.

The first six identify the first person in the Trinity as the only creative agent, and I therefore reject them following the logic of Jackson, above. The seventh casts the ‘son’ in a passive role and looks odd alongside the traditional affirmation that

“God is love,” not just the third person in the Trinity. The eighth is promising, as Abba probably has less explicitly male connotations for English speakers, even though it is masculine in Hebrew.

In the final stages of preparing this thesis I heard that the soon to be released Uniting in Worship II, a worship resource manual designed for Uniting Church congregations, will contain one service with female images of God, though this was highly controversial decision leading to the resignation of several committee members. It has, then, become official Uniting Church policy to affirm, though not to require, the use of female images of God alongside traditional males ones.

So we can move beyond andropocentrism and still be Christian. Can we go further and escape our anthropocentrism?

I believe that the formulation I first used in a sermon on June 18th, 2000 is a useful attempt. It drew on a lecture in 1992 by Arthur Jackson and a sermon in about 1995 by Andrew Dutney. They spoke of the doctrine of the Trinity as the early church’s experience that the God they knew of as creator of all that is, they also met in Jesus of Nazareth, who lived amongst them. Not only that, they continued to experience Jesus of Nazareth amongst themselves after the resurrection. In order to acknowledge this insight, in the light of the discussion above, I have begun to formulate the Trinity as the God who “is beyond us, became one of us, and remains within and amongst us.”

This formulation is similar to Dizdar’s, “God beyond-all, God-with-us, and God-within-all,” except that his label God-with-us does not highlight a core Christian affirmation that in Christ God was not just with us, but actually became one of

---

775 Assembly Standing Committee unconfirmed minutes of meeting held July 2004.

776 It remains for other things we say about God to highlight Jackson’s point that our language about God must preserve the intimate, loving aspect. Of course, this is the case even in the classical formulation, since not everyone who hears “Father” or “Son” thinks of loving intimacy.
us. Dizdar’s formulation is valid, it simply doesn’t go as far as it could. Dutney uses the phrase, “God beyond us, God against us, God within us,” but the middle part makes it clear that this is not directly a Trinitarian construction so much as an affirmation of three experiences of God.

My formulation, I believe, provides a valid Trinitarian foundation which is at least potentially consonant with the scientific story. In escaping not only androcentrism but anthropocentrism; it addresses the Shepard’s criticism that expanding the image of God to include women only slightly widens humanity’s narcissistic religious mirror,

“All the humanized deities were insufficient substitutes for a zoological theriophany… the dead end of making gods in human form.”

How, then, do we include this zoological theriophany in the image of the Trinitarian God which Christians worship? Two approaches suggest themselves. A predominantly anthropocentric possibility simply expands the image outwards from humans to include at least some other species. A more biocentric alternative would recentre the image to life itself, with humans included in the image alongside of other species.

9.1.2.3 Broadening the anthropocentric image: humans at the pinnacle

I will start with the more anthropocentric approach, which admits that whatever the image of God is, at least some other animals reflect it, though to a lesser degree than humans. We would thus be the exemplar of the image of God, and the anthropocentric claims about God’s image would need only slight modification. We would remain very much at the pinnacle, but we would need to

---

777 The Apostles’ Creed carries this strong assumption, with Jesus’ birth from the virgin Mary (Owen, ed., Witness of Faith, p. 42.) The Nicene Creed explicitly affirms that Jesus was, “made man [sic]” (Owen, ed., Witness of Faith, p. 52.)

778 Andrew Dutney, Food, Sex and Death- a Personal Account of Christianity (Melbourne: Uniting Church Press, 1993), p. 82.

780 Ibid, p. 293.
expand the circle somewhat. We would admit that we are not the only creature which shows signs of rationality, morality, language, culture, freedom etc, but would emphasise that we do express each of these things far more fully than any other animal we know of.

If Westermann is correct that the image of God is a statement about the ability to relate to God, then Edwards should be arguing for an hierarchical image of God, since he claims that all creatures relate directly to God at some level, in that Christians are,

“…linked in relationships of kinship and community with all other creatures in a global koinonia of the Holy Spirit.”

To include other creatures in the image of God would, however, place him outside the realm of Catholic dogma. Amongst Protestant theologians there is more freedom to explore a hierarchy in the image of God, indeed the above section would seem to require it. Although an increasing number of theologians do accept that there is no ontological distinction between humans and other animals, they tend not to reflect on the implications of this for the conception of the image of God. Langdon Gilkey is one exception,

“God is only dimly known here, barely perceived and stumblingly described - as is the wonder and mystery of nature through which God is thus dimly known. As we have seen, nature is an image of God, a creaturely reality of immense creative power, order, and value, an image of the sacred, and

---

hence a finite reality or value for itself... *Nature is for itself and us the medium through which God's power, life and order are communicated to us* (emphasis mine).  

For Gilkey, ‘nature’ is an image of God, separate from the human image. He then goes on to profoundly diminish his claims for nature, and subordinate it under the human image,

"... what is known of God in nature represents by no means the centre of the knowledge of the divine for most religious traditions, and certainly not of God for the Christian... The consequence... is that *what I am trying to do here, while important, is not vital to the centre of Christian theology.*

So Gilkey actually suggests nothing more than the already widely accepted proposition that we see something of God in the processes of nature, though he is one of the very few to use the language, “Image of God” to describe this.

Sallie McFague also explicitly admits that we are not the only creatures made in the image of God, and goes on to claim that human sin is our failure to stay in our place and accept our proper limits, to make room for other species. Rather than speak of two images (nature and the human), she seems to envisage a hierarchy within the image of God, which relates directly to a hierarchy of value amongst species, with humans at the top.

Process theologians mount a sustained defence of this hierarchy of value. Of all the modern theological systems, process theology is the one most open to affirming a continuity of being between humans and other organisms.  

---

786 Ibid.

787 Seen, for example, when she contrasts the needs of a hungry human child with that of ‘animals’, and automatically prioritises the former (Ibid, p. 117.)

788 Indeed, process theology goes beyond life to affirm a basic continuity between all matter.
are no longer seen to be of, “… infinitely more value than the whole Earth.” As Nancy Howell, a process theologian puts it,

‘Whitehead extends the term ‘person’ to include most animals. Humans, animals, and vegetables are societies of events or experiences, in Whitehead’s view. Living bodies possess an internal organizer that coordinates the events and relationships that make up individuals. A “person” is one whose experiences are so organized that they form a coherent and recognizable being. Humans and vertebrates in particular are described by Whitehead’s notion of person.’

What defines a person, then, is not an ontological category, but an assessment of how coherent its comprehension of experience is. Birch calls this the person’s richness of experience. The richer a life form’s experience, the more a person it is, and the more intrinsic worth it has.

Since human beings are thought to possess the greatest capacity for richness of experience, they exist at the top of the hierarchy of intrinsic worth. For example, Barbour argues that because a mosquito has less richness of experience than a human, it is of less intrinsic value. Process theologians go on to contrast intrinsic worth with instrumental value, or the value of an organism to others,

“… a human being is more valuable than a mosquito to itself, to other beings, and to God.”

The first claim is surely true: most humans value their own lives more than they do the life of a mosquito. The second claim is surely incorrect. To a frog, for

---

791 Barbour, *Nature, Human Nature, and God*, p. 131. See also Birch, "The Liberation of Nature," p. 9. This is developed in Birch and Cobb, *The Liberation of Life: From the Cell to the Community*. Birch distinguishes his approach from that of Singer, whom he says focuses only on the capacity to suffer of an animal. Their positions are actually extremely similar, see Peter Singer, *Animal Liberation: A New Ethics for Our Treatment of Animals*, 2nd ed. (London: Thorsons, 1991), p. 8. Birch’s explanation of intrinsic and instrumental worth remains unchanged through until 2000, where he explicitly uses the principle to suggest differences in intrinsic worth amongst humans based on their richness of experience, again much like Singer (Birch, "Environmental Ethics in Process Thought," pp. 3-5. In this recent article Birch acknowledges that both his and Singer’s systems have very similar outcomes.)

example, a mosquito is of much more instrumental value than a human being. Indeed, humans have a negative value to a frog, both as predators and habitat destroyers. They have a negative value to many species for the same reasons, as the many litanies of ecological destruction testify. I will assess the third claim, that each human has more value to God than other life forms do, later in the thesis.  

The hierarchical use of intrinsic worth in process theology leads to problems when it engages with other theological discourses, where intrinsic value implies equality. McDaniel illustrates the problems which arise when both senses are combined uncritically. He refers approvingly to the World Council of Churches, Church and Society Working Committee, which talks about intrinsic value as something absolute, a claim that something is loved by God. This reflects a core Christian affirmation that God loves the world, declaring it good. Later in his paper, however, he uses intrinsic value in the hierarchical process sense,

“\[The greater a living organism’s capacity for sentience, exemplified in part by the complexity of its nervous system, the greater its intrinsic value.\]”  

Combining the two approaches we conclude that the more intelligent something is, the more intrinsic value it has, and therefore the more God loves it. We are led logically, though McDaniel does not appear to recognise this, to conclude that since not all beings are intellectually equal, they are not all equally loved by God. Tony Kelly, who uses process theology and Teilhard de Chardin as his basic framework, states this explicitly. He claims that God created the universe to be completely free of divine control because only something which is truly free is worthy of love,

“A mere creature is no fit subject of God’s love. However a self-created [self-conscious] entity could be an appropriate subject of God’s love, if it was otherwise similar to God.”

---

793 Chapter 9.5
795 Ibid, p. 231.
Few ecotheologians, indeed few theologians, would be comfortable with such an explicit rejection of the fitness of creation to be loved, or even instituting a hierarchy of love. Many more would recoil from the obvious implication that, since not all humans have similar intellectual capacity, or richness of experience, not all humans are equally loved by God.

As Singer and Tom Regan point out, human babies have inferior capabilities on any scale to adults of some other species. Some humans with profound intellectual disabilities will be permanently inferior to some animals on any scale of intellectual or emotional maturity. Since there is no ontological gap between humans and other animals to fall back on, a hierarchical image of God will necessarily create a hierarchy amongst humans, saying that some humans reflect the image of God less than others, and that some reflect the image of God less than animals of other species.

Carol Christ criticises hierarchies of intellect or consciousness at the level of whole cultures. She points out that theologies which elevate intellect and self-reflection can unwittingly imply that cultures which do not value such things are less valuable, or less human. At the recent Christianity after Darwin conference in Adelaide Tony Kelly appeared to do just that. He claimed that Australian Aboriginal culture was pre-moral, as indeed was all human culture before 1000BC, because their intellect was less developed than western culture. Yet, he added, only humans who had developed truly moral culture expressed the

---

797 Singer, Animal Liberation, pp. 16, 239-40.

799 Singer, Animal Liberation, pp. 16, 239.

801 Kelly, "An Emergent Christology". These comments were made by way of example and do not feature in the text. In response to sustained audience questioning he described morality as being the ability to do the right thing, even if the law proscribes it.
kind of freedom God sought; a self-creating creature which was finally worthy of being loved. Only the people who represent this final emergent stage are free to relate properly to God, or as we would say to express the image of God fully.

So, at both the individual and cultural level, retaining the traditional evidences of the image of God, and thus creating a hierarchical image, leads towards affirmations which are anathema to contemporary theology. Whilst the church has argued in the past that all humans are not equal, and do not equally bear the image of God, the principle of human equality has been espoused by almost every Western theologian for the last three centuries. This includes both Catholic and Protestant theologians, and both link equality to the possession of the image of God. Barth typifies the Protestant project,

“Man [sic] is not elected to intercourse with God because, by virtue of his humanity, he deserved such preference. He is elected through God’s grace alone... It is a distinction of every being which bears the human countenance... The acknowledgment of this distinction has nothing to do with an optimistic judgment of man [sic]. It is due him [sic] because he [sic] is the being whom God willed to exalt as His covenant partner, not otherwise.”

The equality of all people, as bearers of the image of God, has been unanimously affirmed by the councils of the Uniting Church. To call this into question, which we must do if it is hierarchical, since there is no ontological gap between humans and other animals, is a last resort.

Gregory Peterson to a large extent moves us beyond this approach. He refers to Gilkey’s work, but has a more positive assessment of its importance than Gilkey.

---

803 Rachels, Created from Animals, p. 175.
805 Ibid, p. 52.
himself, correctly identifying the fact that the reinterpretation of the image of God has enormous consequences for theology, being a core Christian concept. He rejects Gilkey’s two images approach, instead locating humanity within the one image of God which we see in nature, in what he admits is a tentative reinterpretation. He points out that consciousness is a very difficult concept to define, regardless of the model of consciousness being used, and therefore does not believe that simply expanding the image of God to include conscious or self conscious creatures is sufficient.

He initially appears to move away from McFague and the process theologians when he proposes that the locus be moved from human beings (and our consciousness) to nature itself. All of life is the image of God. Yet he still allows for human pre-eminence, based on our consciousness, which has allowed us to become more the image of God through our taking on the responsibility of being caretakers for the planet. So we are pre-eminently, perhaps especially, the image of God, based not on ontological difference, but stewardship. Peterson then calls his own line of reasoning into question, asking,

“Isn’t it the height of human arrogance to assume that because we, in our mature adult stage, are a bit more intelligent than other creatures, we are more like God?”

He concludes that, “… the old strategy of emphasizing the difference between human beings and animals… is no longer viable.” Yet this, on my reading, is what he does when he allows that we are pre-eminently the image of God, for surely this implies that we are more like God. Peterson seems to acknowledge this tension without attempting to resolve it, his aim after all is to speculate so as to stimulate discussion rather than drawn firm conclusions. Having rejected the hierarchical notions he entertains, I will pursue his line of thinking in which the image of God is relocated to life itself (he says nature). What, in other words, are the possibilities of a biocentric conception of the image of God?

---

808 Ibid.
809 Ibid: p. 299-301.
9.1.2.4 The biocentric image of God

Ivone Gebara calls us beyond the anthropomorphic God,

“By analogy, God is a human person, the sap of human life, but
also the sap of life in trees, in flowers, in animals, and in all that
exists. By analogy too, God is man, woman, breeze, hurricane,
tenderness, jealousy, compassion, mercy: Mystery.”

This sounds non-hierarchical, and indeed she explicitly demolishes any central
apex in life, “… there is no single pivotal reality on which we all depend; rather
all depends on all. The centre is in all and in everything.”

This radical revisioning of the image of God stands in stark contrast to the
traditional image, even as it slowly expanded to include women, and then other
creatures in a subordinate place. Gebara dares to revision God so completely
because she accepts that thoughts about God have never been static. She accepts
the anthropologists’ claim that human images of God have evolved over time;
that the idea of a supreme Being is the result of a slow evolutionary process, one
of many hypotheses. The supreme Being, she acknowledges, was, “… clearly
fashioned in the image and likeness of the human personality.” Nonetheless,
because this image has evolved, “… we can gradually prepare ourselves to
consider other images of ourselves and of the mysterious reality we call God.”

Stephen Dick agrees that the idea of a supernatural God is,

---

812 Ibid, p. 115.
813 That is, changed in response to the environment in which the human societies lived, not improved.
815 Ibid, p. 113.
“… of course, a historical artefact, a product of the evolution of human thought. It was the great innovation of the Judaic tradition, which began about four thousand years ago… Although it has proven a resilient and flexible concept, a supernatural God is no different from other powerful ideas developed throughout history, in the sense that it is useful, persistent, and subject to change.”

Kwok Pui-Lan points out that the image of God now so common and unquestioned amongst Christians strongly reflects the western culture it evolved in. The kind of image proposed by Gebara is no shock for many Asian theologians,

“Western anthropocentrism thinks of God in terms of the image of human beings: God is king, father, judge and warrior. God is the Lord of history, intervening in human events. On the contrary, Oriental people and Indigenous people who are tied to the soil imagine the divine, the Tao, as silent and non-intrusive… earth as mother who is sustaining and life-affirming (emphasis mine).”

I have not yet, however, seen Kwok Pui-Lan use any explicit metaphors, apart from Tao, to convey what she is proposing. To my western mind, there is a tension between the very passive, “silent and non-intrusive” God, and the actively, “sustaining and life affirming” one. How, if one is silent, can one affirm anything? And how can something be sustained unless there is some intrusion on the part of the sustainer?

What is clear is that, “A shift from anthropocentrism to bio-centrism necessitates a change in our way of thinking and speaking about God.” More explicitly, “To develop a feminist ecological model for Christology, we have to… dare to use non-human metaphors…”

---

819 This tension also exists in process theology, which also fails to adequately resolve it, as I shall argue later.
I have already mentioned that such metaphors were the dominant ones, if not the only ones, in pre-agricultural societies. Catherine Keller points out that they persisted, as very much a minority voice, even in cultures overrun with female and then male images of God. In her exploration of the book of Job, she notes that, after the voice from the whirlwind, Job says to God, “now my eyes see you.” What Job has actually “seen” in the whirlwind, however, is not some anthropomorphic God. Rather, Job saw, “… only the creatures. To ‘see’ God is to see the creation.\textsuperscript{822}

So for these thinkers the image of God is blown wide open. \textit{Biological Life} is the image of the living, but non-biological God. It is the juxtaposition of the billions of year’s long stream with the current web - the venous cross section- to which we need to look for the image of God. Peterson is the only theologian I found who endorses this stream-like view of the image of God, and then only implicitly. I have already noted that he affirms nature as the image of God, and to this we can add his proposal for a theologically promising metaphor for the evolution of life as, “… living waters, flowing in many directions and curling around in unique and beautiful patterns.\textsuperscript{823}

In affirming the pulsing flow of life as the image of God, I am not advocating a return to animism. Biocentric theology transcends the reliance on individual animals as totems of the gods. Different individuals do not contain different parts of the image of God - \textit{life} is the image of God\textsuperscript{824}. Life as the image of God, rather than \textit{lives}, is consonant with the suggestions from the science story that the boundaries around species and bodies are more fluid than we think. The first anthropocentric proposition is invalidated, not by negation, nor even really by

\textsuperscript{823} Gregory Peterson, “Being Conscious of Marc Bekoff: Thinking of Animal Self-Consciousness,” \textit{Zygon} 38, no. 2 (2003): pp. 254-55. He only mentions this metaphor in a concluding sentence and has not yet developed it in any published material.

\textsuperscript{824} Process theology rejects any ontological difference even between what we commonly call life and non-life, so that the image of God would then be matter itself. Whatever the strengths of that approach, it is sufficient to make my point to talk of life as the image of God, and will prove less clumsy in sections to come.
expansion, but by explosion. We look to figure 14, rather than the mirror, to see the image of God.

The kinds of distinctions we make amongst objects and organisms are part of our biological survival tool-kit, which all creatures possess. I propose that God, who is not a biological entity, and thus would not have evolved the same need to discriminate as we have, is able to see and relate directly and primarily to, life, the venous cross section of all that has been and will be. That is, not only is life in the likeness of God rather than the human alone, life relates directly to God, rather than through the human.

This brings to mind the second anthropocentric assumption, that the God-life relationship on Earth is somehow mediated through the God-human relationship. Humans alone have been mandated, since the beginning of creation, to exercise some form of dominion over life on Earth. The link between the image of God and the mandate for dominion is an intimate one. Radford Ruether claims that modern Hebrew scholarship sees the image of God as the mandate for dominion. Westermann, who rejects so close a link, still admits that in the text, as well as in later interpretations, “dominion over the rest of creation is the consequence of the image and likeness of God (emphasis mine).”

We might already begin to suspect theologically that if all life bears the image of God; all life would be that which exercises dominion on Earth. How does that fit with the scientific story?

---

9.2  *H. sapiens* as divinely appointed stewards of creation

9.2.1 Summary of the scientific data

The idea that humans could ever exercise dominion over the entire *universe*\(^{827}\), with its seventy thousand million million million solar systems, is ridiculous. The more humble claim in Genesis and most ecotheology is that we are granted dominion over life on *Earth*. Even this is implausible in the science story.

We have seen that human beings have been present on Earth for only a minute fraction of its history, and will probably be here for only a minute fraction of its future. Life evolved and interacted for billions of years without us, and will continue to do so. The idea that we were appointed to exercise stewardship over creation from its beginning to its end is historically impossible\(^{828}\).

According to the science story, if anything has dominion over life on Earth, it is the microbes. Nothing else would survive long without them. They were the first organisms, and they will be the last. They make up far more of the biomass of life on Earth than humans, about half of the total biomass of Earth at present\(^{829}\). It is the microbes which created, and drive, the life systems of Earth\(^{830}\).

“Bacteria, never having gone extinct, continue to protect us as their populations grow prodigiously. They maintain soils for us and purify waters\(^{831}\).”

\(^{827}\) As we saw for example in Uniting Church in Australia, “Minutes of the 1985 Assembly”, p. 160 (appendix 1).

\(^{828}\) Some might argue that, from the beginning of creation, God foresaw and foreordained that *H. sapiens* would arise at a particular moment in world history to exercise stewardship. Whatever the merits or usefulness of such an idea, it is very different from the traditionally accepted view that we *H. sapiens* has been around for the entire history of life on Earth. It also leaves Earth without our stewardship for 99.99…% of its history and future, thus making human stewardship a far more humble project than traditionally assumed.

Life on Earth is dominated by unconscious organisms, selected for their ability to consume resources. Of secondary importance ecologically are species like ours, adapted to live off microbial and plant waste products like oxygen. Consciousness and rational thought play a miniscule role in shaping the development of life on Earth.

All organisms shape their environment, and the more complex their nervous system the more deliberately they do so. Many use technology to assist them, especially birds and mammals, and amongst the latter especially primates. Humans, with the most developed nervous system we are aware of, have produced technologies with astounding resource manipulation abilities compared to other primates, to the point where a large proportion of technology is used to manipulate the environment in ways which have no biological survival value. Likewise their ability to reflect on the consequences of each manipulation, and respond accordingly, is greatly developed, though rational reflection certainly does not guide all human decisions. Since not all humans have access to the same technologies, it is relatively few who have such an enormous impact on life on Earth compared to their requirement for biological survival.

9.2.2 Theological responses

The majority of theologians grappling with the relationship between humans and the rest of creation have failed to take the above data seriously. This is the only explanation for the continued ubiquity of the distinctly anthropocentric metaphors like humans as stewards and/or priests of creation, charged by God with responsibility for guiding the development of life on the planet.

9.2.2.1 Continued defense of *H. sapiens* as steward or priest

I have already shown that stewardship is the dominant model by which the Uniting Church resources describe the relationship between humans and the rest of creation, even if it started to lose its stranglehold recently. This is a microcosm

---

of the wider theological landscape, where stewardship still holds sway\textsuperscript{833}, largely because of the preoccupation with the current perceived ecological crisis. The main agenda appears to be to get Christians to do something, and stewardship supports that agenda admirably. It needs to be remembered, however, that even this apparently broad interest in ecotheology remains a minority tradition in Christian theology as a whole, and a small part of the life of worshipping communities. Most Christians, certainly in terms of what they do, and possibly even in what they confess, still operate more or less out of a domination model\textsuperscript{834}.

The widespread attempt to move people away from domination is typified in Dieter Hessel’s appeal,

“Our \textit{primary vocation} is to care for creation with love that seeks justice. Love does not insist on its own way, the \textit{normative human role} is that of \textit{earth keeper or household manager} to be exercised with humility (emphasis mine).”\textsuperscript{835}

It will come as no surprise that Orthodox and Roman Catholic theologians, because of their prior commitment to maintain the ontological distinctiveness of human beings, promote anthropocentric images of humans as stewards or priests of creation.

To take Orthodoxy as an example, we see the claims about humanity remaining unchanged from the 1990s to the present. Gennadios Limouris, introducing a collection of Orthodox contributions to the WCC JPIC project in 1990, claimed that, “The human being is both king and priest; he/she has been given by God the responsibility to rule, but that responsibility goes with the priestly role of prayer and meditation.”\textsuperscript{836,}

In his 2002 review of Orthodox teaching on the environment, Tamara Grdzelidze recalls the unanimous teaching of the Orthodox fathers that the human being is the crown of creation, a bridge between heaven and Earth, put here to reign over Earth’s creatures. Not only are we to act ecologically responsibly, but,

“The task of humankind is to go further then the mere preservation of creation; it is to purify creation, and elevate it to the level of its creator.”

So the Orthodox expand humanity’s role from a fairly technological sounding stewardship role, to a royal priestly role. Far from questioning anthropocentrism, they elevate it.

Despite all that the ecofeminists call into question about Roman Catholicism and the Orthodox church, the strong desire for practical outcomes prompts some to uncritically adopt very similar stewardship type models, because of their usefulness. Catharina Halkes, for example, claims that we are here to rule Earth for God, as his representatives, “All is transferred to us in order that we may protect it, may preserve and keep watch over the garden, may see to it that justice is done to everything and everyone.”

Increasingly, however, theologians have grown uncomfortable with these metaphors, based partly on the inability to reconcile them with the massive sweep of the evolutionary story of life.

9.2.2.2 From steward to co-creator

Clare Palmer summarises well the critique of stewardship metaphors, so I quote her at some length,

“One particular danger of such a search [for new language about our relationship to the rest of creation] is the tendency to latch on to already existing, familiar concepts which seem at first

glance to solve the problem. In fact, these terms may act as blinkers which block out deeper consideration of the question at issue. It is this which I am suggesting has happened with the widespread adoption of ‘stewardship’ to express the relation of humans with the rest of the natural world.\footnote{Clare Palmer, "Stewardship: A Case Study in Environmental Ethics," in \textit{The Earth Beneath: A Critical Guide to Green Theology}, ed. Ian Ball, et al. (London: Spck, 1992), p. 67.}

“In the light of evolution, the idea of human metaphysical ‘set-apartness’ becomes impossible to justify. However, the concept of stewardship continues to support this set-apartness.\footnote{Ibid, pp. 78-79.}

“The contention that man [sic] is needed to look after the earth stems from a preevolutionary understanding of nature. It is perhaps influenced by the idea that nature is ‘fallen’ and imperfect, requiring human activity to perfect it. In the light of evolutionary science, the idea that earth ‘needs to be managed’ by humans is obviously a nonsense, although still maintained by some theologians… If humanity should become extinct, as all species ultimately seem to do, then life on earth will continue to flourish…\footnote{Ibid, p. 79.}

Palmer, unfortunately, does not go on to offer an alternative language to describe how humans and the rest of creation are related. This tendency to identify conceptual problems without offering much of a solution is widespread in ecotheology. This need not be surprising, since the endeavour is still relatively new. For example, at around the same time Palmer wrote, David Hallman edited a major work on ecotheology, in which he claimed that,

"We are in the early stages of a profound conceptual shift in theology that will move us far beyond stewardship theology as a response to human exploitation of God’s creation… our approach is still a management model in which we humans think we know best. By breaking open that conceptual prison, feminist theology and insights from the traditions of Indigenous peoples are both critically important groundings for the emerging ecotheology, as the articles in those chapters demonstrate.\footnote{David G. Hallman, "Beyond "North/South" Dialogue," in \textit{Ecotheology: Voices from South and North}, ed. David G. Hallman (Maryknoll, NY: Orbis, 1994), p. 6.}"
show, ten years on from Hallman we are still very much in the early stages of this profound shift, especially regarding our ability to offer new language which incorporates the understandings of evolutionary biology into a desire to see Christians adopt a more life affirming faith.

As recently as 2000 Santmire found it necessary to argue that we should retire the words dominion and stewardship, “… for the foreseeable future… These terms still carry too much baggage from the anthropocentric and indeed androcentric theology of the past…” He believes that we need to escape “evolutionary anthropocentrism,” proposing that we are called to cooperate with nature and care for nature. This sounds anthropocentric all over again, but the sorts of care and cooperation he describes are fairly limited in scope.

For example we are not to care for nature as a whole, as if we were its supervisors, but to minimise our ecological impact on other species. It is a little unclear, then, how central H. sapiens is to the scheme of things in Santmire’s thought. He clearly believes that humans are fundamentally different from other life forms. According to Santmire, we can only have I-Ens relationships with nature, not I-Thou ones. I-Ens is Santmire’s term for relationships between humans and beings which are not persons, but not simply “Its” either. He believes that I-Ens overcomes Martin Buber’s idiosyncrasies, which arise from his reservations about using I-Thou to characterise the human-non human relationships.

Yet Santmire overstates the problem. For example, Santmire claims that Buber admits to having, “… no unified answer to this question,” of the character of the nature of the reciprocity of things in nature to us. Buber actually said, however, that, “… no sweeping answer can be given to this question. (Walter Kaufman’s

---

843 Santmire, Nature Reborn : The Ecological and Cosmic Promise of Christian Theology, p. 120.
844 Ibid, p. 44.
847 Ibid, p. 68.
translation)” and then goes on to give a two part answer in terms of threshold and pre threshold I-Thou relationships. Personally, I think Santmire’s addition is unnecessary, since as he admits the thou/it/ens categories are fluid anyway, as explained by Kaufman in his prologue to his translation of Buber.

As part of his I-Ens framework, Santmire calls humans to cooperation with the rest of creation, which brings to mind the work of Philip Hefner. Hefner explicitly rejects stewardship as a model, proposing instead that humans are the created co-creator,

“Human beings are God’s created co-creators whose purpose is to be the agency, acting in freedom, to birth the future that is most wholesome for the nature that has birthed us - the nature that is not only our own genetic heritage, but also the entire human community and the evolutionary and ecological reality in which and to which we belong. Exercising this agency is said to be God’s will for humans.”

This book won the 1993 Templeton prize in the field of science and natural theology, and became widely influential, being used explicitly, to name a few examples, by Michele Grimbaldeston, Elizabeth Johnson, Limouris, McFague, Peacocke, Peters and Dorothy Soelle.

849 Ibid, pp. 16-17.
855 Peacocke, God and the New Biology, p. 106.
856 Ted Peters, Playing God? : Genetic Determinism and Human Freedom, Second ed. (New York: Routledge, 2003), pp. 16-20. He also seems to refer to Hefner favourably in other works (Peters, Science, Theology and Ethics, p. 237, Peters, "Theology and Science: Where Are We?,” p. 65.)
It is not at all clear, however, that being a co-creator is much different from being a steward. Hefner explicitly retains humans at the centre of the story of God and creation. Birthing the future sounds an even grander task than simply exercising stewardship. We have not, then, moved beyond deep anthropocentrism, and Palmer’s criticism of stewardship seems just as applicable to co-creation.

9.2.2.3 From co-creator to humble servant

The same could be said of various efforts to recast humans as the humble servants of creation, rather than its lords. This is seen in the work of Habel and Hiebert, who point out that the call to dominion in Genesis 1 is very different from the call to till and keep (which Habel translates, “serve and preserve”) the garden in Genesis 2. They are absolutely correct. Yet they overstate the non manipulative nature of the second image, that of protective gardener. The image still assumes that agriculture is the good, divinely given order of things, rather than an evolved trait with significant ecological consequences, and as we have seen, theological ones also. The idea that humans are here to guard and protect the Earth is certainly nicer than that we are here to tread down and dominate, but it is not any truer for that.

Linzey, who engages with animal rights more than evolutionary biology, calls us to reject our humanocentric prejudices and become the servant species. Yet his own humanocentrism is seen in that he imagines that we alone could exercise this servanthood, or that we would know what is best for other creatures. This intuitively seems to be truer the more we consider the action of some humans

---

858 See Habel’s comments on Genesis 1 and 2 in Rainbow Spirit Elders, Rainbow Spirit Theology: Towards an Australian Aboriginal Theology, p. 79. See also Normal C Habel, Resource Manual for a Season of Creation (unpublished draft, 2004), liturgy cycle A, commitment. This is reiterated and expanded in the online Bible Studies which were created to supplement the Season of Creation worship materials (Normal C Habel, Bible Studies on the Readings for a Season of Creation (Cycle A) [pdf file] (2004 [accessed 3 September 2004]), available from http://victas.uca.org.au/creation.)

859 Westermann, Genesis 1-11: A Commentary.

which directly lead to habitat loss, or pain and suffering of animals, in experiments for example. As such, Linzey’s call to reconsider those actions, and even actively work against those who do not, is helpful. But to talk generally, in an evolutionary context, about humans as servants of the rest of life does not really move us beyond the deep anthropocentric assumptions more commonly expressed through the stewardship paradigm.

9.2.2.4 Radical reformulation of the role of the human

By far the most popular metaphor used in the attempt to push beyond anthropocentrism is the ecologists’ metaphor of life as a web of relationships. The metaphor has been equally powerful in secular environmentalism. The model has greatest currency amongst those who reject unique human stewardship or co-creation. Carol Christ is typical when she calls us to recognise our, “… profound connection with all beings in the web of life,” not just ecologically, but ontologically. She goes so far as to claim that we need, “… to know that we are no more valuable to the life of the universe than a field flowering in the colour purple, than rivers flowing, than a crab picking its way across the sand - and no less.”

Yet even those who promote humans as stewards or servants or co-creators, whether divinely preordained or as something we have evolved into, occasionally use the web metaphor to describe the world over or in which we must exercise our unique role. They call us, for example, to recognise “our intrinsic communion

---

862 For example Zimmer, Evolution, p. 190.
with this web of life. Even Edwards, who proclaims the ontological distinctiveness of *H. sapiens*, uses the web of life concept to argue that humans have a relationship of kinship and community with all life in the, “global *koinonia* of the Holy Spirit.”

The ease of the metaphor’s adoption by people from such different theological world views should give us pause. Its wide adoption is possible because the metaphor itself is a grossly impoverished picture of the complex relationships occurring between organisms and their genes at any moment in time. It also fails to convey the dynamic nature of the evolution of life through history, and falsely implies the action of an external, conscious agent in its creation. Its simple, static, and designed allusions make it easily adoptable by traditional anthropocentric theology. Yet none of the more biocentric theologians who use the metaphor have reflected long enough on its implications to be driven to critique, let alone reject it. Repeatedly they pass over deeper theological analysis in their rush to expound the ethical implications of the web’s apparent unravelling at our hands.

870 As discussed on page 42

"We were not created to dominate and rule the earth, for it
governed itself well and better for millions of years when we did
not exist or existed as nondominant mammals… Stewardship is
not a primal command, but an ex post facto effort of dominant
males to correct over abuse and become better managers of what
they have assumed to be their patrimony, namely, ownership of
the rest of the world." 872

She points out that even after we did evolve, we were not a dominant species until
a few hundred years ago 873.  McFague has a similar position, based on the
ecological insight that complex life forms like us are completely dependent for
survival on simpler ones, but not vice-versa 874.  Microbes steward us.  Celia
Deanne-Drummond makes a similar point about prokaryotes 875, but also
emphasises that the power of life to regulate conditions on Earth is not absolute-
many external factors come into play.  Stewardship, then, even by all of life, is a
limited affair 876.

Gebara accepts that other organisms exercise not only dominion but also the
creativity which dominion requires.  She admits that the creativity of an orange
seed, “is surely not the same as human creativity,” but claims that it, “… clearly
participates in the ongoing and awesome creativity of the universe.” 877 To this we
could add countless examples of animal creativity and construction which
undermine a human-exclusive understanding of the created co-creator model
popularised by Hefner.  Chung Hyun Kyung explicitly expands Hefner’s
metaphor to include all of life, such that, “… human beings become co-creators
with God and nature (emphasis mine).” 878.  Process theology could be used to add

872 Rosemary Radford Ruether, "Ecofeminism: The Challenge to Theology," in Christianity and
Ecology : Seeking the Well-Being of Earth and Humans, ed. Dieter T. Hessel and Rosemary
873 Ibid, p. 104.

878 Chung Hyun Kyung, "Ecology, Feminism and African and Asian Spirituality: Towards a
Spirituality of Eco-Feminism," in Ecotheology : Voices from South and North, ed. David G.
weight to this argument, since it sees agency and creativity emerging from matter itself.

So it seems that some theologians have accepted the ecological reality of life on Earth, and accepted that all of life exercises dominion. The traditional intimate link between the image of God and dominion is thus preserved, but both have been profoundly expanded.

McFague, however, appears to pull back from this conclusion. She argues that with our evolved power comes responsibility. Far from being plain members of the Earth community,

“We are decentred as the only subjects of the king and recentred as those responsible for both knowing the common creation story and helping it to flourish… we have become, like it or not, the guardians and caretakers of our tiny planet… It is an awesome vocation, a far higher status than being a little lower than the angels, subjects of a divine king, or even the goal of evolutionary history (emphasis mine).”

But is this realistic? Does it have any connection to the evolutionary processes of Earth? It implies that the evolutionary processes which have worked for billions of years are now to be supplanted by *H. sapiens*. What does it mean to help life flourish? To care for it? McFague leaps from a mostly biocentric theology to an anthropocentric ethic, but she offers no convincing basis for doing so. She seems to be driven by the desire to call humans to action, to make them responsible for their deeds and thus the reparation.

Are humans responsible, and for what? It is time to consider the final leg of the anthropocentric stool, the idea that *H. sapiens* is, as a species, culpable for the Fall.

---

881 Ibid, p. 201.
9.3  *H. sapiens* as the agent of the Fall

9.3.1 Summary of the scientific data

For billions of years before humans evolved, organisms passed into and out of existence. For at least hundreds of millions of years they were born, experienced joy, pain, suffering, and died. All the realities of creation which are cited as evidence of a fall from God’s original designs for the world precede human existence, and so cannot literally be attributed to human disobedience of divine decree. They are instead inevitable consequences of the evolutionary process. There was never an Adam and Eve who brought ruin on the human race and creation, and in who’s sin we share. The scientific story reverses the traditional theological story. In the Genesis story as usually interpreted, humans brought about death and pain. In the science story, pain and death “brought about” humans.

Pain and suffering and death (finitude) are an essential part of the evolutionary process. Finitude may be the result of the deliberate action of beings, but is mostly the result of random events, from base pair mutations to asteroid strikes. It also results from the pursuit by organisms for resources, including each other. The different success rates in obtaining these resources is a driving force in evolution. Even though cooperative alliances may evolve, they are alliances against other resource competitors, and only continue if they promote the survival of the collaborators over others. The evolving web does not preclude love and joy and moral virtue, indeed they evolved out of it, but it does preclude a view in which life on Earth is envisaged solely as benign, loving, and nurturing.

Human beings have initiated an unprecedented era of extinction and individual death on Earth, but it is not the first. Earth has experienced a recurrent wave of falls in biodiversity. Such falls, including this one, only affect the lives of vertebrates and complex plants to any great extent. Nonetheless, because there
were more vertebrate and plant species when humans evolved than ever before, the current extinction event is the biggest in global history. We are the first single species to be the primary agents in such a fall, and the first agent to be able to consciously alter its impact. We are also the first species in which some members have interacted so differently with their environment than others. This is not so much a human initiated fall as a techno-human initiated fall, increasing in severity as technology advanced from fire to stone, metal, and now oil and silicone based tools.

During these mass extinction events the persistence of any one species, or even family or genera is fragile. The existence of all humans, rich and poor, is highly contingent upon the ongoing availability of certain resources, and our ability to defend ourselves against those organisms which constantly try to use us as a resource of their own. The more we spread and turn the world into a homogenised system with us as the dominant consumers, the faster microbes which can exploit us as a resource will evolve and spread amongst us. We have already seen around the world that the survival of humans with limited access to technology is precarious in the face of their growing population, and the technology mediated consumption of their basic resources by humans in other parts of the globe.

In the bigger life picture, we know that the repeated cataclysms, local and global, which have reduced biodiversity, have not completely choked the flow of life. New channels form, just as they do, less spectacularly, every second of the day. What happens after a cataclysm is that the channels flow in new directions, seen for example in the extinction of the dinosaurs and the subsequent colonisation of the planet by mammals. The mechanisms through which life evolves are, the scientists tell us, indifferent to the forms life takes. Unlike the persistence of any one species, the flow of life is not at all fragile, it is highly flexible, and adaptable.

---

882 If we go by the actual number of species, and probably organisms affected, but not if we consider percentages, since past extinction events annihilated much greater percentages of species in existence at the time.
Most ecotheology is a direct response to the perceived human mediated mass extinction event now unfolding. These responses vary widely, largely around the issue of the ‘nature’ of creation, and whether the finitude which is part of the ecological and evolutionary process is a good to be embraced, or an evil to be overcome.

9.3.2 Theological responses

The Genesis story and the science story are not exactly the same kind of stories. Theology and Christian faith are comfortable dealing with mythological stories, knowing that they may claim things which are beyond the ability of science to verify, such as the existence of God in the first place. But we cannot simply try to take the theology of the Genesis mythology and the history of the science story as coequal and independent. We have rejected the path of the “two spheres” approach, in the Uniting Church at least.

We have already seen that the Reformation Witnesses referred to in the Basis of Union take for granted the historical reality of a perfect Edenic state from which, through human sin, the world has fallen. Not all Christian theology makes this assumption, but it overwhelmingly does assume the chronology: first humans, then pain and death. The opposite appears to be true, and theology must engage with this reversal.

This false chronology is clearly assumed in the eco-engaged resources in the Uniting Church, which convey the impression that before humans arrived, Earth was Edenic. I repeat one quote as a reminder,

“We believe in God… who spun a web of shimmering life, where creatures grew and changed… Each needing all the others, held in delicate kinship. We believe in God… who patiently provides for each according to their need. Who blankets the drowsy wintering spider with warm earth so she may go about her business in the springtime… God calls us as the church to love the earth, to live humbly in the web of relationship, to announce the new wilderness (emphasis mine).”

883 An affirmation of faith (Assembly Social Responsibility and Justice Committee, "Healing the Earth," p. 31.) Already cited on page 34.
Similarly romantic visions continue to dominate resources produced by the Uniting Church. At the time of writing, the Victorian Synod of the Uniting Church is working on a major project which will transform September into a liturgical season of creation. The draft document describes Earth as a longsuffering, loving parent\textsuperscript{884}. The booklet for the preplanning retreat, which I attended, uses the metaphors of Earth as Alive, Celebratory, Parent, Sufferer, Family Tree, and Sanctuary\textsuperscript{885}. Discussions during the retreat envisaged Earth solely in positive terms, the only exception being my expressed misgivings about the lack of a “kick your arse” Earth.

This non-creationist Eden is not limited to Uniting Church resources. Mark Wallace’s enthusiasm for poetic theology skims heedlessly over ecological reality, “... nature is the enfleshment of God’s sustaining love. As Trinity, God bodies forth divine compassion for all life forms in the rhythms of the natural order. The divine Trinity’s boundless passion for the integrity of all living things is revealed in God’s preservation of the life-web... the Father/Mother God’s creation of the biosphere, the Son’s reconciliation of all beings to himself, and the Spirit’s gift of life to every member of the created order who relies on her beneficence for daily sustenance (emphasis mine).\textsuperscript{886}.

For Wallace, though I am not sure what he could possibly mean\textsuperscript{887}, the ecology of organisms is “... best symbolized by Jesus’ reconciling work of the cross,” and the, “life-web,” is, “... a living testimony to the Divine’s compassion for all things.\textsuperscript{888}.”

\textsuperscript{884} Habel, Resource Manual for a Season of Creation, the resource has no page numbers.

\textsuperscript{885} Normal C Habel, The Earth Files: Biblical Sources for Exploring Our Spiritual Connections with Earth (Draft) (Adelaide: none, 2003). Earth as sufferer related to the human impact on ecology, not the pain which is intrinsic to life.

\textsuperscript{887} Presumably something about life following death.

Many ecotheologians base their Edenic visions on their understanding of Indigenous ways of looking at the world,

“This cosmic interwovenness [or African and Asian spiritualities] is a wholesome, harmonious and compassionate web of relationships… based on justice: no exploitation, manipulation or oppression, but mutuality, deep respect and delicate balance.”

Whilst this is an understandable reaction to often Earth-negative western spiritualities and theologies, it is not at all clear that Indigenous or pre-industrial societies actually held the sort of romantic notions read into their spiritualities by westerners. Even if they do, they have not prevented Indigenous societies from having a massive ecological impact on their surroundings, as I documented when I considered Fejo’s sermon. Birch briefly summarises more evidence to show that Indigenous people’s religions did not led them to be superior conservationists. Based on extensive work with New Guinean tribes, Jared Diamond documents that whilst they were often affectionate to domestic animals, torture and maiming of wild animals was commonplace. He concludes,

“... prehistoric peoples throughout the world are human: neither animals, nor paragons, but human. Like other humans throughout the world, New Guineans kill those animals that their technology permits them to kill. The more susceptible species become depleted or exterminated.”

He also gives a broad analysis of the tendency of all human societies to collapse, because of ecological mismanagement. This seems to be avoided only amongst those humans who live in areas with no easily domesticatable plants or animals, forcing them to maintain a more nomadic lifestyle. One such place is Australia.

---

890 Page 42.
891 Charles Birch, Biology and the Riddle of Life (Sydney: UNSW Press, 1999), p. 102-03.
Even if Australian Aboriginal spiritualities did dictate the way they interacted with the landscape, rather than vice-versa, Veronica Brady correctly warns modern westerners that trying to adopt Aboriginal spirituality is both “delusive and dangerous,” a form of sentimentality, an adoption of words and feelings which are not really our own 896.

Rather than seek recourse to apparently more ecologically ideal societies, some authors claim to find in western science itself evidence for a pre human Eden, though they provide no data,

“Neither theology nor ethics has truly fathomed what science presents us as bearers of meaning and power and as cosmic story-tellers in an infinitely magnificent evolution… [producing] the only oikos we know and the only one that is fine-tuned for our survival (emphasis mine).” 897

“Perspectives from science show us that the earth was designed to be sustainable, how delicately balanced the natural systems are… “Both science and the Bible clearly show that God created a perfect earth.” 898

Both quotes are at odds with the weight of the scientific stories I outlined in chapter 8, in several respects. Firstly, they ignore the vast fluctuations in the flow of life through evolutionary time - the history of mass extinction events which preceded human evolution. They reflect the simplistic web of life I have already rejected. The only form of scientific support they could claim would be the recent interest in the anthropic principle, a fascination of cosmologists. Because it is mostly a cosmological argument I do not want to go into details. Suffice to say, the above quotes rely on the strong version of the anthropic principle, which is widely discredited. Even then, by claiming that the earth is perfect they are extrapolating well beyond what even the strong version of the anthropic principle states.

The scientific data reveal the exact opposite of a perfect Earth, fine tuned for our survival. Rather we are part of the vertebrate lineage, which is part of the eukaryotic lineage, which is part of the microbial lineage which was selected for its resistance to increasing oxygen levels billions of years ago. We are adapted to Earth, not the other way around.

The rejection of mainstream western thinking, and the desire to bend it into the service of proclaiming Earth as perfect and good is understandable. Certainly it is an advance on the long western Christian tradition of ignoring or vilifying Earth and its creatures, labelling the life community as fallen and marred by sin. It is not, however, a view that can be pursued by those seeking to integrate the findings of ecology and evolutionary biology into Christian theology. Birch offers a sustained critique of romantic approaches to “nature.” This style of ecotheology is not actually “eco” theology at all, since it fails to engage with even the basic data from the ecological sciences. It is basically traditional anthropocentric theology, continuing the belief in a pre human Eden marred by human activity, even if it greatly extends the time period over which Eden existed, and holds out hope that the Edenic state can be recovered through responsible human action. It might be called Earth friendly theology, though it is difficult to know exactly what friendly means in this context. It seems to mean slightly different things to different authors, but most agree that it is, or was meant to be, friendly.

9.3.2.1 Finitude as evil

Sally McFague, for example, emphasises a web of life which exhibits, “the solidarity of each with all,” such that, “all life forms share the basic goods of the planet (emphasis mine).” It may be arguable that all are in solidarity in that they live together on the same planet. In theological use, however, solidarity implies something much more positive and cooperative than what ecology tells us about the interrelationships amongst living organisms. It is absolutely not true

that all life forms share resources if by that McFague implies any sort conscious or unconscious generosity. McFague goes on to explain that,

“A spirit theology focuses attention not on how and why creation occurred either in the beginning or over the evolutionary aeons of time, but on the rich variety of living forms that have been and are now present on our planet (emphasis mine).”

Yet in romanticising the interactions of these living forms it is debatable the extent to which her spirit theology really does focus attention on present ecology. Further, an understanding of present ecology, its actual nature, is not possible without an awareness of the evolutionary history which produced it. McFague, then, deliberately ignores evolutionary biology as a focus point, and fails to engage with the implications of its details, even though she does mention it at some length. She does, however, engage with the reality of death and pain and suffering, seeing them as natural evils, and tragedies. This attitude is nearly ubiquitous. Even such a staunch atheist and rationalist as Dawkins cannot refrain from making value judgments about the finitudes of life, referring to mass extinction events as “fearful global tragedies,” and the disappearance of species in such events as “bad.”

As we have already seen, the Orthodox tradition is quite explicit that nature is not what it is meant to be. According to Zizioulas, the role of humanity is to transform nature, “to a fullness beyond its natural capacities,” to transfigure and cleanse it, “from those elements which bring about corruption and death.”

Those theologians who explicitly engage with the story of evolution agree with the Orthodox, and even with Augustine, that there is such a thing as fallenness,

901 Ibid, p. 145.
902 Ibid, pp. 103-12.
903 Dawkins, Unweaving the Rainbow, pp. 75-76.
and that corruption and death are a part of that. Torrance affirms the God who is absolutely against finitude,

“... all physical evil, not only pain, suffering, disease, corruption, death and of course cruelty and venom in animal as well as human behaviour, but also 'natural' calamities, devastations and monstrosities, are an outrage against the love of God and a contradiction of good order in His creation.906,”

Michael Lloyd builds on Torrance to demand that God be against finitude, not only by overcoming it eschatologically, but by being against it from the very beginning907. Yet evolutionary biology forces those who engage with it to substantially revise Augustine's doctrine. Barbour is a typical example,

“...creation, the fall and redemption were understood as separate and successive events... today we can see them as three ongoing features of a single process of continuing creation, continuing fallenness, and continuing redemption (emphasis mine).908.”

In trying to justify their ongoing reference to a state of fallenness, Barbour and his peers revisit the pre Darwinian explanations for suffering and death in the light of evolutionary biology909. The explanation most often adopted for revision is the idea that suffering occurs because God’s gift of free will to humans necessarily enables us to choose to do evil910. The evils of pain and death, then, are not an inevitable property of life, but the result of the decisions made by free agents to turn from the God of life.

906 Torrance, Divine and Contingent Order, p. 139.
909 Rachels summarises these pre Darwinian explanations before examining the ways in which they have been reworked (Rachels, Created from Animals, p. 104.)
In a post Darwinian world, however, free will cannot be attributed solely to humans, but to all life forms in proportion to their consciousness. This explains, it is thought, the presence of pain and death before the evolution of humans, since God allowed the whole creation freedom. Korsmeyer tries to tell the evolutionary story in terms of the freedom which God, through voluntarily limiting God’s self, granted to creatures,

“It is as though Divinity laboured to persuade, to lure creatures forward, creatures who sometimes responded to the invitation, and sometimes did not. But God obviously did not tire of the game, even after being resisted for billions of years. The spectacle of evolution suggests God at work with stubborn individuals who had some power of self-determination.”

“Consider over a hundred million years of dinosaurs, half of which savagely hunted and ate the others. To what end? Was God pleased in some way with this spectacle?”

“God’s power is solely persuasive. God persuades creatures into being, granting them some power of creativity, but not just because God decides it would be nice to do so... Love must share, love requires others... God has all the power that a God could have who created a world with creatures who are really free.

“... these created, evolving entities are finite and what is good for one often means a bad result for others, and because these creatures resist the divine call and seek selfish ends, natural evil is produced. Some beings survive, others do not (emphasis mine).”

Yet this explanation ignores the fact that much of the pain and death on Earth, and the most spectacular extinctions, have been dictated by physical events. They are caused by volcanic eruptions, solar flares and meteor strikes. Unless these things are also somehow resisting the divine lure (a proposition Korsmeyer specifically rejects), then much

911 Korsmeyer, Evolution and Eden, p. 84.
913 Ibid, p. 96.
914 Ibid, p. 123.
915 Rachels, Created from Animals, p. 105.
916 Korsmeyer, Evolution and Eden, p. 106.
of the death and suffering on Earth is not the result of freedom, and remains unexplained.

If God is self-limiting then God is logically responsible for the pain and death which many theologians claim is evil, since God chose to allow freedom in the creation. God is guilty by omission. Yet Korsmeyer tries to elude this conclusion, claiming that,

“… it is the divine nature to love and create, and impossible for divinity to do otherwise. Therefore God is not morally responsible for the suffering that occasionally occurs… God is physically responsible for evil, but not morally indictable for it (emphasis mine).”

Firstly, suffering more than occasionally occurs. Secondly, this is trickery. If it is impossible for God to create a universe which is not free, then God is not self limiting at all, but limited by nature. Yet Korsmeyer does not want to reach this unorthodox conclusion. As he says elsewhere, only beings which are not conscious escape moral culpability when they do evil, whether by commission or omission. Since he claims that God is a conscious agent, God must be morally indictable for any evil for which God is responsible, even if just by refusing to intervene to prevent it. In remaining orthodox in terms of God’s omnipotence, we are driven to the unorthodox conclusion that God has sinned through moral omission, since finitude is evil.

An ontologically limited God, however, being powerless to stop evil, would not be morally responsible for it. Such a God may be totally benign, but powerless to enact his/her benign desires. So claim the process theologians,

“Process theologians hold that the limitation of God’s power should not be thought of as a voluntary self-limitation, as if retaining omnipotence was an option that God decided to give up.”

917 Ibid.
So the process God has not chosen to allow the world to be the way it is, and is therefore not morally culpable for evil. Like the free will theorists, however, they must still address how God does relate to, and shape, the world. Here the free will theorists and process theologians reach basically the same conclusions.

Barbour, a process theology devotee, proposes that God persuades rather than coerces. Korsmeyer agrees, adding the logical conclusion that if God can only persuade, God can be resisted. It is worth repeating a little of his line of thought,

“It is as though Divinity laboured to persuade, to lure creatures forward, creatures who sometimes responded to the invitation, and sometimes did not. But God obviously did not tire of the game, even after being resisted for billions of years. The spectacle of evolution suggests God at work with stubborn individuals who had some power of self-determination, urging them to creatively advance (emphasis mine).”

While it is logical, it is also bizarre. Korsmeyer does not elaborate on how microbes could resist the divine lure, let alone stubbornly. Edwards accepts that biologists see no evidence that evolution is guided by God,

“… comments such as those of Ernst Mayr need to be taken seriously by theology… What a biologist can say… is that the appearance of design in the eye or the brain can now be explained satisfactorily by the theory of natural selection, and there is no evidence from biology that an external divine designer is needed…I am inclined to accept his conclusion… it is possible to think of God’s purposes being achieved through what appears to empirical biology to be without purpose.”

But he cannot resist using the same vague language as the others to claim that evolution is, nonetheless, theologically purposeful,

“The power of self-transcendence comes from within creation itself, but it is a power that finally comes not from nature but from the ongoing creative activity of God. God upholds and empowers the process of evolution from within, as the power enabling creation itself to bring about something new. God, then, is not understood as intervening as one cause among others.

---

920 Korsmeyer, *Evolution and Eden*, p. 84. Also cited on page 42 of this thesis.

but as *the always present, dynamic Creator* enabling creatures not only to exist but also to *transcend themselves* and become what is new.922,

He does not, however, explain what any of this actually means or would look like. Polkinghorne correctly says of such attempts,

“Primary causality seems nothing more than the imposition of a mysterious theological gloss on natural process.”923,

He therefore rejects both the necessarily limited, and self limited, models of God, since they give an inadequate account of divine action, “… which seems to be restricted to the role of a powerless pleading from the margins of occurrence.”924,

Polkinghorne’s solution is the principle of emergence, of top down causality, and of the role of information in systems,

“… it seems coherent to believe that God’s action could be in the form of *pure active information*. This would afford a particular character to divine agency, consonant with theology’s insistence that God is *pure spirit*.925,

Edwards finds this idea limited but useful926, as does Barbour927. Yet there is no such thing as pure active information. *Something else* acts on information. It also seems to underestimate the extent to which the body controls the mind’s thoughts and moods, which would imply that creation controls God. Polkinghorne’s work focuses particularly in physics, in quantum events, so he does not provide a convincing explanation of how this pure information would influence the shape of biological evolution as we see it unfolded.

---

923 Polkinghorne, *Scientists as Theologians*, p. 31.
924 Ibid, p. 33.
In short, the various contributors provide convincing reasons why each other is wrong, or at least insufficient.

So there is a broad range of opinions on the relationship between God and life. Creationists posit enormous coercive intrusions. Intelligent design theorists propose more modest, ongoing coercive intrusions. Roman Catholicism requires at a bare minimum divine intrusion to ensure that each human carries a divine soul. The limited God theorists argue that there is no coercion, but persuasion, though they offer no examples of what that would mean, nor any evidence that contradicts the assertions of biologists mentioned by Edwards above.

What they do is show convincingly why their peers are wrong. Even though the question of divine action remains at the top of the science-theology debate, James Rachels justifiably complains that no testable proposals are ever forthcoming, especially in biology, and that God has apparently acted in the processes of evolution in such a way that it is reasonable to conclude that God has not acted in the process at all. Where is this persuasion meant to occur, or to whom is the pure information made available? If God is influencing the biological (including neural) forms that evolution has produced, then God must be acting persuasively at the level of genetic recombination events, or as an alternative to natural selection. If God has guided evolution towards the creation of *H. sapiens*, then God presumably also manipulated the path of comets and the eruption of volcanoes (since they were crucial events in our evolution), which returns us to the coercive, intrusive God of the creationists.

What the process and self-limiting camps have in common is the declaration that death and pain are necessary *evils*, and the hope that both will, eventually, be overcome. That is, although their integration of science and theology leads them to recast divine omnipotence in novel ways, they retain a very traditional view of death, and God’s ability to overcome it in some final eschatological era.

---

This hope in life after death is immensely appealing, to me no less than many others. On the one hand, our individual biological death is essential if others are to follow us and have a chance at life, and so it is to be strongly affirmed, even celebrated. On the other hand, I freely admit that such celebration will be difficult when my time comes, certainly for me, and hopefully for my family and friends. I have for many years since becoming a Christian softened the stark reality of my own death by imagining that the afterlife involved being able to travel, somehow bodily and spontaneously, throughout the vast array of galaxies and planets in the universe, to finally be able to admire and explore God’s amazing creation. It seemed obvious that this is what God would want. So I empathise with the desire to escape finitude and especially death. This hope is widespread, even amongst those theologians who grapple seriously with science. For Polkinghorne, for example,

"The ultimate futility of this present universe points us to looking beyond the physical world itself to the eternal faithfulness of the God who raised Jesus from the dead, if there is to be found a ground of true hope and everlasting fulfilment."  

McDaniel also hopes that death is less final than biologists suggest. He suggests that after death the souls of animals continue to travel towards a final union with the divine soul. It is at this point, when they merge with the divine soul who has integrated and made whole all their suffering as well as all their joy, that they die. I am not sure whether his delayed death really helps much at all. I empathise with Robert Russell in his desire for a grand eschatological vision, one which we participate in and consciously apprehend. And his inclusion of other animals is a logical necessity now that we have rejected ontological discontinuity. Yet it is precisely his vision which convinces me that eschatologies which imagine a place and time without suffering and death are untenable. Hoping to

---

transcend the limitations of Barbour and Hefner, Russell promotes the idea of humans as “eschatological companions,” of the rest of creation, and spells out his vision of the eschatological event,

“This starting with the events at Easter, God will act to transform the laws of nature to produce the ‘new creation.’ In the coming reign of God, we will not leave behind the coral reefs… or the countless species now long extinct… If the Resurrection of Jesus… is an indication of what lies in store for the universe, then the future will be a transformation of the laws of nature as we now know them into something so transcendently joyous that weeping and pain and disease and dying will be no more, and ‘the lion will lie down with the lamb.’” Somehow, all nature… is destined to eternal life with God in community with each other, a community of unending and bliss-filled experience (emphasis mine). 932,”

But if we are to bring the coral reefs with us, then presumably we will also bring the stonefish which can kill us in a torturous moment. If the supposed laws of nature are changed so much that death and pain and reproduction cease to be, then will we really in any way be ourselves? Russell’s vision seems particularly odd in that he was, as already mentioned, so strong on the fact that ecotheology needs to take seriously the non-static nature of creation. If there is no death or reproduction in his eschaton, then it must necessarily be static. Even if heaven did only contain humans- it is hard to see how we could still be ourselves if transformed from the constantly changing biological organisms we are into eternally static ones. Would dead babies and the profoundly intellectually disabled live forever in their state at death? And if not, what possible connection could there be between their soul, which would presumably have a high level of relationality to other souls, and their actual bodily self? Finally, I have been around happy people. I wouldn’t want to spend eternity with them. This is not a flippant point. An eschaton with no pain or sorrow, or regret, or hurt, an eschaton of eternal static bliss- a kind of Prozac paradise, would be rather a Stepford hell.

933 Thankfully, sex could continue as long as one of the “laws of nature” which God changed is the link between reproduction and sex. S/he could, for example, render us all infertile. This would seem less difficult than changing the laws so that we no longer need to eat.
With the romantic ecotheologians above, then, the evolution-engaged theologians so far surveyed continue to assume that the world ought to be benign; that this is the way God would have wanted it, if only it had been possible. This presumably stems from the Judeo-Christian declaration that Earth is very good. Theologians then seem to almost unanimously assume that a good world is a benign one. It is time to re-examine that assumption, and to reflect on the implications for theology if it is not.

Ecology and evolutionary biology say that death and pain are inevitable, as is suffering for conscious organisms. The evolution engaged theologians say that these things are the result of freedom and free will. They could have been avoided if life made the right choices, since they are the by product of the tendency of free life forms to resist the “divine lure.” The two world views are, then, fundamentally incommensurate. For theology to achieve consonance with the science story it will need to embrace death and pain as inevitably built into the nature of the living world. Ideally, it would even be able to celebrate their existence, since they are essential to the ongoing evolution and interactions of life. Is such a death affirming theology possible, not just in the evolutionary past or biological present, but even in the eschatological future?

Eddie Kneebone, a member of the Church of Jesus Christ of Latter Day Saints (Mormons), answers in the affirmative for the past and present,

“Aboriginal spirituality is the belief and the feeling within yourself that allows you to become a part of the whole environment around you…the natural environment…*birth, life and death are part of it and you welcome each*…”

---

934 Eddie Kneebone, "An Aboriginal Response," in *Creation Spirituality and the Dreamtime*, ed. Catherine Hammond (Newtown: Millennium Books, 1991), p. 89. I could not find any details about his connections to the Mormon Church or wider Christianity, but the same article suggests that his connection is fairly nominal, suggesting for example that God is to be found in the environment, not churches built by people (page 93).
As for the eschatological future, that is of no interest in the kind of cyclical theology which Kneebone recognises in Aboriginal theology, with its ever present Dreaming rather than a hope for a heavenly eternal life.\textsuperscript{935}

Ecofeminists have also engaged with, and generally affirmed death- both past, present and future.

9.3.2.2 Finitude as good

Catherine Keller argues that God is not, “… ‘prolife’ but of life: the life of the world, the spirit of a chaosmos in which death circulates through every living process. (second emphasis mine).\textsuperscript{936}"

Rosemary Radford Ruether has, very influentially, argued for the acceptance of death from 1971\textsuperscript{937} to the present\textsuperscript{938},

“In nature death is not an enemy, but a friend of the life process… Immortality lies not in the preservation of our individual consciousness as a separate substance but in the miracle and mystery of endlessly recycled matter-energy out of which we arose and into which we return.\textsuperscript{940}"

In her later work Radford Ruether mentions the work of Ivone Gebara\textsuperscript{941}, who argues that we must get past the systems we have created which, “… have not

\textsuperscript{935} Ibid, pp. 89-90.

\textsuperscript{940} Ruether, "Ecofeminism: The Challenge to Theology," p. 103.
\textsuperscript{941} Ibid, p. 105. Gebara writes out of the Latin American liberation theology movement, pursuing, as she puts it, an urban ecofeminism.
allowed us to perceive the ephemeral nature of our individual lives and projects.

The affirmation of death is not limited to ecofeminism. For example, Wesley Granberg-Michaelson is inspired by agricultural reality to challenge his readers with the thought that,

“Organic gardeners know that biologically, life comes out of death. Should not this be understood as part of the goodness, or rightness, of the creation, declared in Genesis?”

Andrew Dutney has accepted the challenge from ecofeminism and his own life experiences to take death seriously, both biologically and eschatologically,

“... the questions [about the nature of death] will not go away... Theology will not be able to leave the questions of personal death unexplored indefinitely. It may well fall to ecological theologies to replace theories of the immorality of the soul - now worn to the point of being dangerous - with a more creedal and, indeed, Christian account of the ‘resurrection of the body.’”

His own account of the resurrection of the body does not refer to individual resurrection of somehow conscious persons, for he does not expect to consciously survive his death. He explicitly affirms not only the necessity and value of biological death, but the reality of eschatological death. He recognises the trauma that such a total embrace of death causes traditional theology,

"There is no question that this emphasis causes much tension in the theological conversation with bioethics. Received Christianity has a heavy investment in a spirituality organized around the identification of the person with an immortal soul.

---

942 Gebara, Longing for Running Water, p. 166.

943 Wesley Granberg-Michaelson, "Creation in Ecumenical Theology," in Ecotheology: Voices from South and North, ed. David G. Hallman (Maryknoll, NY: Orbis, 1994), p. 104. Note that Granberg-Michaelson uses one theological affirmation in Genesis, the goodness of creation, to critique its other claims. I will explore what other theologians make of the claim that creation is “good” in the section on the benign web of life.

945 Dutney, Food, Sex and Death.
which survives the death of the body. The questioning of that piety draws strong reactions.946"

So strong, indeed, that in response to reactions from co-contributors to the book for which he wrote the article, the above reflections were omitted from the final version947. And so the final section, originally entitled “Bioethics, Ecology, Theology and … Death” is, in the published book, simply “Bioethics, Theology and Ecology.948.

Yet ecofeminism explicitly questions “that piety.” It does not simply ask us to acknowledge our personal biological mortality; it opposes even the hope for eschatological immorality. The hope for heaven is a form of escapism which prevents us engaging with out finitude filled lives on Earth949. Habel labels the desire to escape Earth, Heavenism950, but does not believe that the hope for eternal life necessarily engenders this attitude. I tend to agree.

There are countless examples in Christian history of people who, convinced that they would have eternal life with God, risked and even embraced death in the cause of engaging fully with life around them. So whilst I agree that the desire for eternal life can express itself in Heavenism, I do not think it necessarily needs to. There is nothing intrinsic to biocentric theology which requires us to reject any possibility of an eternal, “spiritual” life in Heaven. Russel’s attempt951, however, shows the difficulty of envisaging how our present biologically grounded life could relate to that a heavenly afterlife in any meaningful way. Process theology’s attempts to equate eternal life with somehow living on in the memory of God is touching, but being remembered is not the same as being alive. At this point, then, I side with the ecofeminists who call us to embrace our biological finitude, and accept that this represents the end of our life.

946 Dutney, "Bioethics, Ecology and Theology (Unpublished Draft)."

947 Andrew Dutney, 16 August 2004.

950 Habel, Resource Manual for a Season of Creation.

951 Page 42.
In an evolutionary context, this leads to the question of what we make, not only of our own personal death, but the death of our entire species. Not surprisingly, some reject this outright, assuming that the ongoing presence of humans on Earth is an obvious good. Others are more open to human extinction as a necessary evil on the way to the even more conscious species which might replace us. Others reject this manoeuvre, claiming that neither humans nor consciousness are an irreplaceable pinnacle of creation.

9.4 Can theology embrace the extinction of *Homo sapiens*?

It will come as no surprise that many of those who believe that death is an evil decry the possibility of human extinction. This appears to be based not so much in anthropocentrism, as anthropotelism.

9.4.1 No: Anthropotelism

Anthropotelism\(^{952}\) is the assumption that *H. sapiens* is the end point of evolution, the consummation of the entire process. This is usually accompanied by an assumption that the dominant form of development of life on Earth has shifted from biological evolution to some sort of cultural evolution, which, for humans at least, superseded\(^{953}\) and can override our biological legacy\(^{954}\). Often, it sounds as if biological evolution has basically stopped\(^{955}\). So too, presumably, has the need for extinctions.

\(^{952}\) A word I believe I have coined. It is not found in the Oxford dictionary or Google. There is a much worse new word to come, unfortunately.

\(^{953}\) Birch, *Biology and the Riddle of Life*, p. 78. McFague, *The Body of God: An Ecological Theology*, p. 148. Michollet, "Evolution and Anthropology," p. 86. The mistake is present even in scientific texts. Southwood, for example, says that biological evolution of *Homo sapiens* stopped 50,000 years ago, when cultural evolution took over (Southwood, *The Story of Life*, p. 229.) Gould claims that this mistaken view is widespread in science (Gould, *The Structure of Evolutionary Theory*, p. 78.)

The many expressions of this view are reminiscent of the work of Teilhard de Chardin\textsuperscript{956}, whether acknowledged or not. *H. sapiens* represent a new emergent stage in evolution, and Christ was the ultimate human, the Omega point towards which God has lured all life. The next phase is either the perfection of humanity, or the in breaking of God’s eschatological consummation in which the Earth is transformed. Either way, humans represent the latest, greatest, and final phase of evolution,

“The history of the universe reaches its climax when the creative Ground of the whole cosmic process engages in self-giving love with the universe come to consciousness in free human persons (emphasis mine).\textsuperscript{957}.”

The ongoing influence of Chardin was evident at the recent *Christianity after Darwin* conference held in Adelaide. The first two papers explored emergent Christology and the concept that life was processing towards Omega\textsuperscript{958}. Tony Kelly used Chardin to argue that the interplay of morality and culture amongst humans was the stage upon which the final emergent phase in the universe arises: where humanity freely creates itself into the existence of which Christ was a proleptic example\textsuperscript{959}.

This theme is common amongst the most well known practitioners of the science-theology dialogue. For example Peacocke argues that Christ,

“… can properly be regarded as the consummation of the purposes of God already manifested incompletely in evolving humanity… Jesus the Christ is thereby seen… as the paradigm of what God intends for all human beings, now revealed as having the potentiality of responding to, of being open to, of becoming united with God…. He represents the consummation

\textsuperscript{957} Edwards, *Creation, Humanity, Community*, pp. 58.

\textsuperscript{958} Cameron Freeman, "Heading Towards Omega?" (paper presented at the Christianity After Darwin: Doing Theology in an Evolutionary Context, Adelaide, Australia, September 2004), Kelly, "An Emergent Christology".

\textsuperscript{959} Kelly, "An Emergent Christology".
of the evolutionary creative process that God has been effecting in and through the world.  

“… on Earth the epic of evolution is consummated in the Incarnation in a human person of the cosmic self-expression of God… (emphasis mine).”

So the anthropotelic assumptions of some evolutionary theologians are intimately related to the Christotelic tradition of Christian theology. If Christ is an endpoint, a consummation, then so must be his species. First a Catholic quote, then a Protestant one,

“For, the fact that God himself [sic] is man [sic] is both the unique summit and the ultimate basis of God’s relationship to his [sic] creation… The positive nature of creation… reaches its qualitatively unique climax, therefore, in Christ. For, according to the testimony of the faith, this created human nature is the indispensable and permanent gateway through which everything created must pass if it is to find the perfection of its eternal validity before God.”

“If man [sic] is thus the self-transcendence of living matter, then the history of nature and spirit forms an inner, graded unity in which natural history develops towards man [sic], continues in him [sic] as his [sic] history, is conserved and surpassed in him [sic] and hence reaches its proper goal with and in the history of the human spirit.”

Gordon Kaufman is thoroughly anthropotelic, even though he admits that this brings him into conflict with the insights of biology, which he rejects in favour of his received theological tradition,

“As a strictly biological event, [human extinction] would probably be no calamity; many species have appeared on earth, thrived for a time, and then become extinct. But more must be said than that…we humans… are ‘the point farthest out’ of the cosmic-historical process…with the power to take some measure of direct responsibility for the further unfolding of that

---

961 Ibid, p. 115.

963 Peacocke, God and the New Biology, p. 80.
very creativity. Thus the central Christian claim that God has irrevocably bound God’s self to humanity by becoming incarnate in contingent human history receives momentous new meaning. Our fate on earth has become God’s (emphasis mine).  

“[the disaster we may bring through nuclear war]… will not be one of merely human consequence, the obliteration of our species… [but] a disaster for all of life, for the long, slow, painful evolution through which life has proceeded here on earth, finally reaching new dimensions of meaning and value with the appearance of love and truth and self-consciousness and freedom as human history has unfolded. It will be, in short, a disaster for God, an enormous setback for which we humans in this generation will have been responsible (emphasis mine).  

Christotelic faith was easy to maintain in the early days, perhaps even years after Christ died. A few decades later, when the New Testament witnesses were being written, we see the beginnings of the struggle to maintain faith that Christ was somehow the endpoint of history, given that life seemed to be continuing in his absence. For nearly two thousand years Christians continued to struggle with the increasing length of the delay, but prior to geological discoveries of the age of the Earth it was still relatively easy to come up with convincing answers. It was still assumed that the Earth was only thousands of years old, that humans had always been here and always would be until the final eschatological moment when Christ returned. It was also widely assumed that when Earth was finally consumed, that would be the end of the universe.  

In the evolutionary context in which we find ourselves, it strains credibility to believe that the Christ event is an end point of universal history, or even Earth history. For one thing, humans are not the end point of history; we are a mid point of Earth history and very near the beginning of the history of this universe. To think that the most significant event in the universe’s life, or even Earth’s life, has come and gone is, I believe, anthropocentrism gone mad.  

---

964 Kaufman, Theology for a Nuclear Age, p. 44.  
965 Ibid.
9.4.2 Yes: Consciousness-telism

When we look closer at Kaufman’s logic we can discern a more fundamental claim in his thinking than the idea that humans are the purpose or endpoint of evolution. It is because Homo sapiens manifests self-consciousness and freedom that it is such a valuable species. Peacocke, Edwards and others admit that there may have been incarnations on other planets, since it is sentience and self-consciousness which are the fundamental properties to which God relates. It should follow, then, that if it was necessary for Homo sapiens to go extinct in order for the evolution of a new Earth creature with even higher levels of sentience, self-consciousness and freedom, our passing would have to be affirmed as necessary for the greater good.

Along with Polkinghorne, Cameron Freeman claims that evolution on Earth is directed towards the evolution of self-conscious beings, not H. sapiens in particular. He further acknowledges the inevitable extinction of humans, and even celebrates it as a necessary part of the ongoing evolution of life into forms with even higher levels of self-consciousness.

Given that anthropotelism is biologically untenable, even on Earth, is consciousness-telism a more viable alternative? Does it make better use of the data from evolutionary biology? Ironically, even though Freeman relies

---

966 I must agree with my wife that this word, which I also coined, is a real shocker, but it is less of a mouthful than repeatedly expressing the idea it conveys, that the evolution of life is directed towards the production, not of humans, but of self-conscious beings. I promise to use it as sparingly as possible. At least I did not call it self-consciousness-telism!

968 Edwards, “Extraterrestrial Life and Jesus Christ.”

969 The possibility of God being in relationship with extraterrestrial self-conscious beings has been accepted since Medieval times, though its popularity has waxed and waned (Peters, Science, Theology and Ethics, pp. 123-32.)

970 Polkinghorne, Scientists as Theologians, p. 47).

971 Cameron Freeman, July 2004. Freeman presented two papers at Christianity after Darwin, which restricted themselves to anthropotelic musings.
predominantly on Gould for his evolutionary lens\textsuperscript{972}, he dismisses one of Gould’s main emphases; that the evolution of life is completely contingent, and the emergence of consciousness is a chance event, unlikely to ever be repeated\textsuperscript{973}. We have already seen that Gould is not alone when he rejects any sort of ‘telism’, whether towards humans or consciousness. This includes those scientists who are open enough to theology to engage in sustained dialogue.

Stephen Dick, for example, is an historian of science. He rejects the idea that humanity is central to the story of the universe, accepting that we are not likely to be the special object of attention of any deity, purely as a result of the enormous time scales involved,

“… humanity is most likely somewhere near the bottom, or at best midway, in the great chain of intelligent beings in the universe. This follows from the age of the universe and the youth of our species. The universe is in excess of ten billion years old. The genus Homo evolved only two million years ago…\textsuperscript{974},

Although Dick’s reference to a chain of intelligent beings sound consciousness-telic, he is really only using this as an argument for contingency and against anthropotelism. He does not produce any data in support of consciousness-telism, nor does he try to argue that it actually exists. Christian de Duvre is another scientist writing in the same collection of papers as Dick. He, too, acknowledges the central role of contingency,

“… the variations offered to natural selection are induced by causes that are unrelated, except in a strictly fortuitous manner, to the evolutionary advantages their effects may entail. \textit{It rules out any form of directionality} imposed on the evolutionary process by some hidden guiding principle and is consistent with the rejection of vitalism and finalism…\textit{It is supported by all we know of evolution} as it takes place today and by all the findings of molecular biology.\textsuperscript{975}.”

\textsuperscript{972} Freeman, "Heading Towards Omega?". Chapter 8.2.2 shows the perils of limiting one’s self to Gould.

\textsuperscript{974} Dick, "Cosmotheology," p. 201.

\textsuperscript{975} de Duve, "Lessons of Life," p. 7.
The emergence not only of *H. sapiens*, but of intellect, is highly contingent, and due not to some sort of vitalistic pursuit of rationality, but for much more mundane survival advantages through our evolutionary ancestry,

“It must be remembered that the senses whereby the human brain apprehends the surrounding world were refined by natural selection as tools of survival, not of knowledge (emphasis mine).”

Nonetheless, he believes that ongoing “vertical evolution” will probably occur, and may lead to,

“… beings endowed with considerably sharper means of apprehending reality than we possess. Such beings could arise by further extension of the human twig, but they do not have to. There is plenty of time for a humanlike adventure to start all over again from another twig and perhaps go further than did the human adventure.”

Humans are merely,

“… a transient link or perhaps even a side branch in a long evolutionary process very likely to give rise some day to beings much more advanced that we are.”

Although de Duvre describes intellect as a cosmic watershed, he also deliberately undermines its cosmic significance or value. He reminds us that our intellectual abilities are, actually, extraordinarily feeble. He reminds us that we can only hope to apprehend the creator of the entire universe in the most profoundly limited way. Even if there was such a thing as the peak of human intellectual endeavour, it still amounts to very little.

The final nail in the coffin of consciousness-telism is driven home if Ward and Brownlee’s summary of the scientific story of the future of Earth is correct. de Duvre may be correct that more “advanced” beings will follow us in the near

977 Ibid, p. 11.
979 Refer back to page 42 of this thesis.
future, but the mid to far future belongs to the brainless, small and simple; on an Earth in which consciousness, because of the oxygen needed to maintain it, is a fatal disadvantage.

So if those who engage at depth with the scientific data are correct, the evolutionary unfolding of the universe, even Earth, is not only not anthropotelic, but not even consciousness-telic. Nonetheless, because of the massive time scales involved, it is possible that there will be “more conscious” organisms on Earth, and the rest of the universe.

I conclude that consciousness-telism is no more scientifically viable than anthropotelism. Both humanity and self consciousness are contingent, and ephemeral parts of life, and a tiny part of life at that. This fits well with the image of life as a pulsing flow, rather than a hierarchical pyramid. Every aspect of life, for the time it exists, contributes to God’s experience of an other; helping liberate God from a static eternity. Let us further explore the possibilities of a universe where life’s only telos is to live, and where we affirm the extinction of Homo sapiens without needing to believe that we will give way to something “better.” There seem to be two ways of affirming human extinction in this context.

9.4.3 Yes: For everything there is a season.

One view accepts that, were other creatures granted consciousness, the vast majority would declare H. sapiens to be an evil presence on Earth. We as a species have a negative instrumental worth to almost all life. The salvation of most complex plants and vertebrates, as individuals, would be best served by the immediate extinction of humans and our domesticated animals. To maximise the diversity of life, humans must be wiped out to make room for other species to recover and contribute their unique experiences to the richness of God. As McDaniel says, as far as most organisms are concerned, humans are brutal neighbours. From this view, the quicker the oppressor is removed the better.

---

The Judeo Christian tradition, from Exodus to the Revelation to John, provides countless examples of the faithful believing that God destroys oppressors. We even read that God, far from putting humans on a pedestal, lamented our existence,

“The LORD saw that the wickedness of humankind was great in the earth, and that every inclination of the thoughts of their hearts was only evil continually. And the LORD was sorry that he had made humankind on the earth, and it grieved him to his heart. So the LORD said, "I will blot out from the earth the human beings I have created - people together with animals and creeping things and birds of the air, for I am sorry that I have made them.”  

An alternative view highlights that the overall diversity of life experience, thus God’s experience, has been enhanced by occasional mass extinction events. It may be that humans, having provided God with a raft of new experiences, have become the latest in a series of these very useful cataclysms. *H. sapiens* is acting in the same way as the asteroid which removed the dinosaurs, and paving the way for the next manifestation of the flow of life and experience. Humanity’s ecological impact would then be a good part of the process of evolution, enriching the image of God in the long term. Referring back to the John Muir quote with which I opened my introduction, we might see that we were the burning and extraordinary commotion, which prepared the soil for the next blossoming of life.

In order for life to flourish after a mass extinction event, however, the dominant resource users must go extinct. The dinosaurs had to disappear to free up niches for the mammals. Humans and their livestock use about half of the total plant productivity of the planet. Future generations of species, then, rely on our passage to oblivion.

---

981 Genesis 6:5-7
982 Page 11.
983 Birch, "Environmental Ethics in Process Thought," p. 1. Birch actual figure is 40%, back in 1985, I am guessing that twenty years later, given the massive increase in human population and use of technology, this figure would be at least 50%
In the first view humans imperil the very survival of life itself. In the second we simply need to get out of the way, now that we have played our part. Either way, creation is perhaps waiting with eager longing not for our revealing, but for our extinction. This conclusion seems inevitable if we are but plain members of the Earth community, not a product of God’s goal orientated manipulation of evolutionary processes. There is plenty of historical precedent for a non anthropotelic, non hierarchical way of looking at life. Even Calvin reminded us, long before we knew how big the universe really is, that humans are much more like worms than we are like God.  

North American First People apparently had a relatively flat notion of personhood, which persists even amongst those who now identify as Christian,

“In one layer of meaning, these four directions hold together in the same equal balance the four nations of two-leggeds, four-leggeds, wingeds and living-moving things- encompassing all that is created, the trees and rocks, mountains and rivers, as well as animals. Human beings lose their status of primacy and ‘dominion’. In other words, American Indians are driven implicitly and explicitly by their culture and spirituality to recognise the personhood of all ‘things’ in creation.

This echoes the sort of Australian Aboriginal Christian theology encountered outside of the Uniting Church. Kneebone, for example, claims that,

“Aboriginal spirituality is the belief and the feeling within yourself that allows you to become a part of the whole environment around you... all objects are living and share the same soul/spirit as the Aboriginal... The soul/spirit is common-only the shape is different... [we] will return through rebirth as a human or animal or even trees and rocks. The shape is not important because everything is equal and shares the same soul or Spirit from the Dreamtime.

---

984 For example, “The majesty of God is too high to be scaled up to by mortals, who creep like worms on the earth.” (John Calvin, *Institutes of the Christian Religion*, book 2, chapter 6 section 4.)

I opened with the words of John Muir, one of the earlier North American “nature writers.” Henry Beston is a slightly later example of the Western Tradition,

“We need another and a wiser and perhaps a more mystical concept of animals. Remote from universal nature and living by complicated artifice, man [sic] in civilization surveys the creature through the glass of his knowledge and sees thereby a feather magnified and the whole image in distortion. We patronize them for their incompleteness, for their tragic fate of having taken form so far below ourselves. And therein we err, and greatly err. For the animal shall not be measured by man [sic]. In a world older and more complete than ours they move finished and complete, gifted with extensions of the senses we have lost or never attained, living by voices we shall never hear. They are not brethren. They are not underlings. They are other nations - caught with ourselves in the net of life and time, fellow prisoners of the splendour and travail of the earth.”

Mary Midgley reminds us that, theologically, intelligence is not everything, even within the human species,

“…being clever is not obviously so much more important than being kind, brave, friendly, patient and generous.”

McFague accepts that God does not guide evolution, and therefore argues that God desires not rationality, but fecundity and diversity. Carol Christ explicitly rejects the priority of intellect across species, engaging directly with Kaufman. She calls us to see ourselves as different from, but not superior to, other organisms. For example, we may have a relatively developed intellect, but will never fly as gracefully as a swallow, or live as long as a redwood tree. Rather

990 Christ, "Rethinking Theology and Nature."
than believing ourselves to be the pinnacle or end point of evolution (or seeing the consciousness we represent as being that), she claims that the,

“Knowledge that we are but a small part of life and death and transformation is the essential religious insight” (emphasis mine). 991

The “we” in the preceding quotation refers to individual human beings. Yet since Christ believes that H. sapiens is not superior to other species, I think it is justified to expand her affirmation by replacing “we” with the entire species, H. sapiens.

Two pages later Christ acknowledges the possibility of human extinction, though she does not develop its implications for theology,

“The human species, like other species, might in time become extinct, dying so that others might flourish…” 992

With a little extension, then, Christ leaves us with a vision of the extinction of H. sapiens to make way for future species as a positive event, and its acceptance as an, if not the, essential religious insight.

Gilkey accepts that human extinction is an essential part of evolutionary life,

“All in the natural order… even dinosaurs, even humans - comes and then goes; none is necessary, and then all die. This apparently is as true of species as it is of individuals, of phenotypes… for decades we have failed to see its implications for us as a species… Only through the processes of death and of dying - through selection - does life, especially new life, arise (emphasis mine). 993

As with Christ, we can combine this affirmation with his claims about individual death, of which he says, “We cannot live truly and with integrity unless we are willing to die.” Indeed, the enjoyment of life within the courageous acceptance of death, “… represents a spiritual achievement of impressive magnitude,” which is divinely gifted, a sign of the presence of God. 994 Combining his beliefs about

---

991 Ibid.
992 Ibid, p. 323.
extinction and individual death together, we are challenged to see that the acceptance of the extinction of humans is not Homo-phobic, but a spiritual achievement which is evidence of the presence of God. The authors in this section, then, offer us a world view in which we can celebrate human extinction, not as a stepping stone to greater consciousness, but simply as a part of the multi channel pulse of life.

Whilst we are called to celebrate God’s richness of experience, this richness is not equated with rationality. Celebrating richness of experience, freed from the – telism of process theology, provides a better framework for understanding God’s purpose (or mission) in creating life, and thus the missional calling of the church. Or so I hope to demonstrate now.

9.5 Biocentric process theology

According to process theology, and many other ecotheologians, God created the world to enable God to experience the world, to have relationships with life, to have something other to love. This is obviously a claim beyond science, but is a non controversial claim within Christianity. Also unanimously agreed is that God is in some sense at least a living person. Process theologians point out that we, as persons, are both unchanging (in that we are the same individual from birth to death), and changing in response to the many relationships and experiences we have. Very reasonably, it seems to me, they apply this dual aspect of personhood to God,

"Whereas it is true to say that in God's primordial nature God creates the world, it is also true to say that in God's consequent nature the world created God... Our immediate actions eventually perish but yet they live for evermore in the divine memory. This idea that our existence from moment to moment enriches the divine life is part of a stream of thought which stretches at least as far back as Plato and parts of the Judeo-Christian scriptures, through Schelling... Tillich and Whitehead... everything we do makes a difference to God. This is true of the lesser creatures also. God will never be the same.

Apart from the explicit hierarchy of worth, this conclusion still fits perfectly well with a biocentric approach to theology.

I believe that process theology, though very useful, limits itself by slipping from this God focussed perspective to the perspective of individual creatures, mostly in pursuit of a workable ethical framework. This is certainly the case for Charles Birch, easily the most influential process theologian in the Uniting Church.

The ethical preoccupation becomes the balancing of intrinsic and instrumental worth. The intrinsic worth of an organism is said to be directly proportional to its richness of experience, which is proportional to its self consciousness. Its instrumental worth is said to be its value to others. I have already rejected Barbour’s claims that humans are of more value than a mosquito to other animals. What of the claim that God values us more than mosquitos? This is presumably because we have greater richness of experience. But that is meant to be our intrinsic worth, not our instrumental worth.

The easiest way forward seems to be to collapse instrumental and intrinsic worth, which we can do if we maintain a God’s eye perspective. If it is true that God created life in order to have rich experiences, to grow and change, then everything has instrumental value to God. There is no such thing as a valueless organism, or even an object. Since the richness of experience of an individual will enhance God’s experience of life through that individual, then intrinsic value becomes simply an aspect of the individual’s instrumental value to God. To this point process and biocentric theology could, I believe, agree.

---

998 Could any organism then be of no value? Only if God did not exist, and the organism was of no benefit to others. As Christians we can simply reject the possibility on theological grounds, and ecologically declare that it is inordinately unlikely anyway.
We must go further, however. Process theologians focus on the conscious experience of individuals. Their instrumental value to God is that God vicariously experiences the world through their experience. So the more sentient an organism, it is assumed, the richer their experience, and thus the richer God’s experience through them. There is, then, a hierarchy of value of life to God, and a hierarchy of their possession of the image (ability to relate to) God. But this must be challenged at two levels.

Firstly, process theology is too preoccupied with what individuals experience. Since God transcends the material world to some extent, God must also have God’s own experience of individuals, not just an experience of life through them. God has an experience of a mosquito quite independent of that mosquito’s experience of itself. God even has experiences of mountains, and sunsets. Process theology cannot value a rock, but God can, and so can biocentric theology.

Secondly, process theology’s preoccupation with conscious experience is far too limited. If God’s experience through an individual is limited only to the amount of consciousness the organism possesses, then a mosquito may well be of little value. But if we consider the vast array of different sorts of experiences open to God through life, we see that rationality is only one. God, who experiences life through all life, experiences life and relationships in ways totally alien to ours. God experiences what it is to fly like a swallow, and grow like a redwood tree. It is the diversity of experiences of life, not the intellect of the individual, which matters. What God values is the existence of life, and God’s experience of and through that life of something other than God. We cannot even begin to imagine what this is like. As Nagel reminds us, even for us to imagine what it would be like to experience life as another mammal, say a bat with its sonar dominated

1000 Ibid.

1001 According to process philosophy, there is no sharp discontinuity between life and non-life, and all entities “experience.” For the purpose of this thesis I will stay with the experience of life, since this is the preoccupation of the biological sciences, and since, I believe, extending experience to “non-life” adds nothing to my thesis, except another possible point of contention.
perception of the world, is impossible. It is hard enough to imagine life as another human.

We can imagine, though, that God might value the life of the last remaining individual of a species over the life of a common, but more sentient being. Process theology seems unable to do this, since more sentient beings have more intrinsic value by definition. Consider the death of the last elephant. From the process view, since the elephant itself has less richness of experience than most humans, this is less tragic than the death of a human. From God’s biocentric perspective, when the last elephant dies, God’s experience of elephants, and ability to experience life through elephants, ceases. By contrast, the death of one of the billions of humans on Earth leads to far less diminishment of experience. Just how many versions of human experience does God really desire?

Taking God’s perspective also turns a common attitude to people with disabilities on its head. A human with trisomy 21 is often less intellectually able and less self-reflective than other humans. In process thinking and Singer’s ethics they are thus ranked lower on the scale of intrinsic worth than other humans. Yet their experience of the world will contain unique elements not shared by other humans, and thus their birth stands to enrich God’s experience of the world in ways which the birth of another human without that characteristic cannot.

Finally, process theologians like Birch are preoccupied with individuals in isolation. This perhaps reflects their Western context, and preoccupation with practical ethics which have positive outcomes for individual creatures. But it is God’s experience of biological life overall that we want to maximise. This is almost entirely an experience of relationships. Through life forms God experiences their relationships with other life and non-life vicariously. God also

---

1002 Nagel, *What Is It Like to Be a Bat?*

1003 Commonly referred to as Down’s Syndrome, and Up’s Syndrome by a number of people who have it.

1004 This is a highly problematic argument if we have not already rejected the controlling, interventionist God who would manipulate people’s genotypes so as to have a larger variety of experiences.
experiences each life form vicariously through every other life form with which they have contact. Given all that was said in the science story about the pulsing flow of life, that individual bodies and species are to some extent constructs, it is probably more consonant to focus on God’s experience of life communities. Or indeed of the life community. Long before the last elephant dies, God’s experience of elephants in community ceases, their care for each other, their birthing, fighting, love making. Process theology cannot value ecosystems or communities in and of themselves\textsuperscript{1005}, but God can, and so can biocentric theology.

The experience of life which God has accumulated is overwhelmingly non human. This is a staggering insight to try to assimilate into our thinking about our place in the world. Yet God’s experience \textit{does} include experience of and through humans, perhaps especially in the life of Jesus of Nazareth. God is enough like us that we can relate to God. We need to accept, however, that we will never understand God or what God wants for the whole of life. All we can know in principle is what God wants from us humans, though we will never fully understand why. So we can see Jesus as the revelation of God to us, to tell us what humans should be on about, without pretending to know anything of what God wants for the rest of the world. This humbles our ethical projects enormously. We are compelled to recognise with Albert Schweitzer that,

\begin{quote}
“We cannot understand what happens in the universe… It creates while it destroys and destroys while it creates, and therefore it remains to us a riddle.\textsuperscript{1006}"
\end{quote}

Schweitzer concludes that any ethical decisions about which life to sacrifice and which to save are purely arbitrary, often simply revealing our own bias that the things most like us are the most valuable\textsuperscript{1007}. Birch makes just that assumption,

\begin{footnotes}
\item[1005] Birch, "The Liberation of Nature," p. 9. McDaniel does call us to a \textit{love of} communities and systems, but follows Birch in not attributing rights to them, but rather to the entities which comprise them (McDaniel, \textit{Of God and Pelicans}, pp. 89-92.)
\end{footnotes}
and specifically rejects Schweitzer’s “reverence for life” ethic because the ethical outcomes are too difficult to apply\textsuperscript{1008}. Despite Birch’s criticism, there appears to be considerable overlap. Birch argues that Christians are called to have a reverence for life\textsuperscript{1009}, and Schweitzer, despite his rejection of the objectivity of a scheme like Birch’s, nonetheless admits that circumstances will force people to decide which life to sacrifice and which to save on a case by case basis\textsuperscript{1010}. In earlier work, in apparent contradiction to a rigorous application of his ethic, Schweitzer explicitly states that human life is a special case. Though we might put animals out of their misery, the spiritual nature of the human means that we must always preserve their life, even if it causes them suffering\textsuperscript{1011}. This seems at odds with his later work, but I found no specific retraction. So he appears to grant an exception to his own biocentric sounding framework. What might a consistently biocentric theological framework look like, one which draws on process theology but freed from its consciousness-telism. Does it have anything practical to say to those who desire to live ethically, or is Birch’s criticism of Schweitzer equally applicable?

\begin{itemize}
\item \textsuperscript{1008} Birch, "The Liberation of Nature," p. 9.
\item \textsuperscript{1010} Schweitzer, \textit{The Teaching of Reverence for Life}, p. 47.; Schweitzer, \textit{My Life and Thought}, p. 271.

This is a collection of sermons preached in 1919. The absolute value attached to human life may reflect the recent horrors of World War I and the desire to leave no excuse for a repetition.
\end{itemize}
10 A biocentric framework

“Theology may need a transformation as remarkable as the decentring of humans as the focus of the God-world relationship.”

Here Nancy Howell suggested as a possibility that which I am arguing to be essential. The suggestion came at the end of Howell’s sustained consideration of current knowledge about chimpanzees, and the ever closing gap between them and our species. It represents a true effort to listen to evolutionary biology. Unfortunately, rather than explore the theological implications, Howell focussed on the ethical. She presents a laudable history of the way women have been equated with animals to stress their inferiority in patriarchal cultures, and the pseudo science used to do it. As with Birch and the bulk of ecotheologians, her concern is with the practicalities of applied ethics. Even though she briefly returned to her original theme in her closing remarks, her concern is still with the implications for humans,

“… we can learn to de-centre humans long enough to focus on the animals’ perspective... in learning to take a chimpanzee perspective, we stand to learn more about human evolution and culture (emphasis mine).”

And then, alas, the endnotes. My claim is that Howell’s call to decentre humans as the focus of the God-world relationship is an essential step for theology to take. I therefore present another image, and explain why Christians ought to embrace it. I then describe the kind of mission the biocentric images in this thesis calls us to engage in, and what to make of Jesus in this context. Because so many of his followers contrast Jesus’ teachings with the legacy of supposedly selfish evolution in which we developed, I look briefly at how a biocentric ethic might embrace both Christ’s teachings and our evolutionary legacy. This is largely achieved by combining Jesus’ focus on riches and poverty with the biocentric affirmation of the essential continuity of all species. Finally, ecology and evolutionary biology

---

give us some clues as to where and how biocentric Christian communities might flourish, as well as a foundation for their ethics.

### 10.1 A biocentric vision

A biocentric theology treasures the richness of relationships experienced by God of and through life, a richness enhanced primarily by diversity not consciousness, and by community as much as individuality. It allows us, with God, to celebrate our inevitable extinction, without at all being Homo-phobic. Christian funerals have long been both an acknowledgment that we miss the one who is dead and a celebration of a life well lived. God’s funeral for Homo sapiens may have much the same air, as it did for *H. neanderthalensis, erectus, ergaster, rudolfensis, habilis, floresiensis* and so on.

We have seen that we are a tiny tributary in the massive flow of life. We are a significant, but not central, collection of strands in an inconceivably massive and complex flow of relationships. I proposed that the pulsing flow of life is a better image of God than *H. sapiens* ever will be. I would now like to describe another metaphor which is grounded in water\(^{1014}\).

Biocentric theology conceives this point in Earth history as a wave on the shore where God and creation meet. A wave of relationships\(^ {1015}\). Ours was the biggest wave yet seen\(^ {1016}\), a boiling, foaming mass which raced up the shore after the dinosaurs went extinct. Now it is in retreat. How long until the next wave comes crashing in? How much of this wave will build the next, and how big will the next wave be? We do not know, and most likely we never will, as humans are not likely to be in the next wave. You and I certainly will not be. What we do know is that even if there is another large wave or two, the tide is definitely on the way out, and it will never come in again, on Earth at least.

---

\(^{1014}\) Pun intended. Anybody who has read this far deserves at least a little dry humour. Pun intended.

\(^{1015}\) Conscious-telic devotees could see the wave as a wave of consciousness.

\(^{1016}\) There were more species alive before humans developed agriculture than at any other point in history, though they add up to less than 1% of all species which ever lived.
Can we accept that we are but a tiny part of a wave of relationships on the shore where God and creation meet? Does this lead us inevitably into a kind of fatalistic world view in which, as mere parts of a wave beyond our control, we passively accept the rapid destruction of habitats and species around us? This God’s eye view, this acceptance of evolutionary processes, including all its finitude and contingency, might raise the spectre of academics sitting in ivory towers, remote from the injustices of the world.

I believe that a workable ethic can be constructed which reflects the biocentric theology I have been promoting in this thesis. I begin by showing that, whatever our ignorance of the ultimate purposes of God, our own purposes drive us to be concerned about what happens to the rest of creation, based largely on the biophilia hypothesis I outlined in chapter 8.2.6. I then return to the God’s eye view, expanding on the question of what it is that God values from the world. This allows us to begin to sketch an ethic which is rooted in biocentrism but still able to address the ethical concerns of those who care deeply for the Earth community, perhaps, I hope, in a somewhat more consistent and even more hopeful way.

10.2 Biocentrism: What’s in it for humans?

The central commandment which Jesus left his followers, according to the synoptic gospels, was to love God. We are called to love God, not because God is some insecure despot who needs it, but because it is in this that we have life in abundance - eternal life.

Although my discussion will sound somewhat cold and rational, my own starting point, and doubtless of anyone trying to do ethics, is a passionate, emotional connection to life around me. Ultimately, I refrain from needlessly stepping on ants because something deep within me is horrified when life is callously discarded, not because of any logically thought out ethical position. Nevertheless, the complexities of such little decisions add up to the point where it is worth taking time to think through the ways in which the many competing claims upon someone who loves life might be balanced.

John 17:3. It is beyond the scope of this thesis to explore the extent to which this payoff was seen to be a present reality, or a future, post death reward.
To love someone, we must know them, at least partially. The writers of the New Testament epistles urged people to know God, having found that this knowledge brought freedom\textsuperscript{1020}, wisdom, revelation and hope\textsuperscript{1021}, an end to exploitation\textsuperscript{1022}, and the ability to love\textsuperscript{1023}. Not to mention the escape from the vengeance of God’s wrath\textsuperscript{1024}. To talk about God, to do theology, we must believe that it is possible to know God, or at least something of God.

To know somebody, we need to know what they are like; we need an ‘image’ of them, a likeness. Even in our relationships with other humans, we do not have direct access to all they are. All we have is our image of them, the synthesis of who they really are and who we, from our past experiences and limited interchanges with them, imag(in)e them to be. The more time we spend with them, we hope, the better our image of them corresponds to reality. The better our image of them corresponds to reality, the more we know them. The more we know them, the more we can truly love them.

To know God, then, to love God, we need an image of God. This thesis has argued that the image of God we need to grasp is not \textit{H. sapiens}, but life, past and future, on Earth and elsewhere. The richer this image of God, the richer our knowledge of God and ability to love God. It is clearly an image we will only ever see a little of, but we must do what we can to see it. To paraphrase 1 John 4:20,

“How can we say we love God, whom we cannot see, if we do not love the image of God, which we can see?”

Here Christian theology grounds itself in and expands the biophilia hypothesis we encountered in chapter 8.2.6. This was the idea that maintaining ecosystems similar to those of the Pleistocene, in which most of our brain evolution occurred,

enhances our mental and emotional well being. For example, McDaniel, coming from the process tradition, argues that since we are indivisible from nature, we must cooperate with nature to nurture our selves. Thomas Berry claims that,

“Our soul life is developed only in contact with these surrounding experiences... if this outer world is damaged, then the inner life of our souls is diminished proportionately.”

Rosemary Radford Ruether explicitly embraces the concept of biophilia. She argues that the degradation of the environment leads to a loss of “aesthetic imagination” which robs us of the moral urge to value life. It is not surprising to find such sentiment in those from the eco-engaged part of the Roman Catholic tradition, which has a long standing theology of creation as sacrament. This assumes that we can, through contemplating life around us, connect with the Creator of Life.

Edwards, for example, believes that, “… Earth reveals. It is the place of encounter with the Holy Spirit (emphasis mine).” In this encounter we engage God the uncontrollable Other, the Spirit who blows where it will. Yet this revelation is limited. Because he sees finitude as evil, it follows that it cannot be part of the image of God. Elizabeth Johnson also limits the revelatory power of creation. For example, she explicitly denounces extinction as an evil which detracts from the sacramental potential of Earth,

“… all diverse strands in the web of life are expressions of the creative power of the cosmos which is ultimately empowered by the Creator Spirit. The enormous diversity of species itself

---

1029 Ibid, p. 65.
1030 Edwards, "Evolution and the Christian God," p. 188.
1031 His thought shows some nuances on this matter, however, since, against Moltmann, he doubts that past species are really victims of evolution, nor that the death of a creature necessarily makes it a victim of its predator in a justice sense (Edwards, The God of Evolution: A Trinitarian Theology, p. 111-13).
points to the inexhaustible richness of the Creator; whose imaginative goodness these species represent… when a species goes extinct we have lost a manifestation of the goodness of God.\textsuperscript{1032}

Zizioulas was another of the death denying theologians in chapter 9.3.2.1. For him, much of what we see in creation needs transforming; it is the not-God we must overcome. Zizioulas does not embrace the otherness of the rest of creation, but imagines that it will be changed to suit us, a paradise by human standards,

“The Kingdom of God is not something that will displace material creation, but will transfigure it, cleansing it from those elements which bring about corruption and death.”\textsuperscript{1033}

Even the death affirming theologians like Radford Ruether, when they talk about the sacramental possibilities of creation, emphasise its positive aspects. God brings forth all things in life-giving interrelations, so that,

“The whole creation must be seen as the bodying forth of the Word and Wisdom of God and as sacramentally present in all things.”\textsuperscript{1034}

When we combine Radford Ruether’s sacramental affirmation with other passages where she embraces finitude, we can adequately engage with Wilson. As cited above, he reminds us that biophilia is not a romantic love of the pleasant parts of life, but an attachment to, immersion in, and participation in all of life, including the bits that make us fearful and anxious\textsuperscript{1035}. The wild Other he reminds us about reveals to us God’s shattering otherness\textsuperscript{1036}.

\textsuperscript{1035} Wilson, “Biophilia and the Conservation Ethic,” p. 31.
\textsuperscript{1036} Fox, “God’s Shattering Otherness.” It is intriguing that Fox reaches this conclusion, since she is so affirming of Zizioulas’ work.
Keller’s view of creation, for example, sacramentalises not Gilkey’s God of order\textsuperscript{1037}, but the God of chaotic deep (Genesis 1:2),

“For it is this complexity that is all too quickly perceived as chaotic and therefore as threatening, as mere disorder, as ugly, or as nothing. Therefore my project works from the bottom up - or rather, from the bottomless tehom up: to counteract the entire tradition of the demonization and erasure of chaos.” \textsuperscript{1038}

Like Keller, David Tacey calls us to live with uncertainty, chaos and confusion, rather than rushing to neaten things up\textsuperscript{1039}. He laments that,

“… in our secular world the Other has lost its capital ‘O’ dimension and has become an ‘other’ human being, a lover, a friend, a husband or wife…” \textsuperscript{1040}

Brady warns us that, “Shrinking from the otherness of land is the other side of shrinking from the otherness of God.”\textsuperscript{1041} By denying that those parts of life we fear are sacramental, we have diminished the image of God. God has become like us, liking what we like. This is manifest in the extreme when we make the image of God \textit{actually human}. By removing ourselves from everything fearful in life, everything wild, we have diminished our experience of the Otherness of God\textsuperscript{1042}, and thus limited our ability to love God.

Patricia Fox criticises our tendency to reduce both the God and non-humans to our image\textsuperscript{1043}. As she points out, there are,

“… profound implications of speech about God both for the future of life on this planet \textit{and for the human person’s capacity to know and relate to God} (emphasis mine).” \textsuperscript{1044}

Seeing life as the image of God gives us a far richer, more beautiful, awesome, wonder filled, humble, yet robust faith foundation. The ultimate glimpse of this image incorporates the entire evolutionary history of life on Earth, and probably throughout the universe. It accepts even mass extinctions as, paradoxically, events by which the image is enhanced and enriched.

Yet few humans are able to engage with such an image, and even those of us who can struggle to hold it before us constantly. The image of God which is available to us is primarily the tiny part which we encounter every day, not the three billion to three trillion year old one we may intellectually believe in.

If we could immerse ourselves in even this tiny encounter with God in the day to day reality in which we live, our faith would be greatly enriched. Most rich humans now engage with wild animals through television. Yet is the lion, not the documentary about it, which reminds us that “It is a fearful thing to fall into the hands of the living God". The second most common sphere of interaction for the rich is the supermarket fridge, the stocking of which is a major cause of local extinctions.

Most humans, whether urban or rural, live in areas where non domestic animals are locally extinct, or confined to specific parks. In such parks, if they are dangerous they are caged, or the humans are forced to stay in their cars. Non dangerous animals are usually tamed, like the kangaroos that can be hand-fed, or the koalas that are prostituted out on a cash for cuddle (and photo) basis. Most humans, if we interact regularly with any other forms of life, do so only with pets. This was already becoming the case when the Hebrew Scriptures were being compiled. Although they refer to the occasional dangers from wild animals, the dominant paradigm for human interaction with other animals is agricultural. Christian theology has usually continued this paradigm unquestioningly.

“The idea of responsibility for the animal kingdom as a whole is clearly neobiblical, especially “caretaking” and all its benevolent expressions. These are three: The Noah syndrome,

---

which puts us in charge (as God’s stewards) of *all* the animals; the hagiographic model of Saintly Hermit before whom the beasts, recognizing human holiness, gladly enter into cringing servitude; and the Peaceable Kingdom, the prototype of our perception and regulation of nature as if it were a nursery school playground.

Belief in human stewardship is, according to Shepherd, a symptom of a biophobic culture. It reflects the desire for the world to be the way humans like it - safe, controlled and productive. The same could be said of the desire for a paradise of peaceable existence amongst animals, by which we really mean their control and domestication. According to Shepherd, humans as stewards or saints, and our peaceable eschatology, all reflect the projection of the domestic world onto nature. They,

“… take wild animals one step closer to becoming slaves along with their domestic cousins. Wild animals are not our friends.”

I have participated in a number of Christian worship services where the value of the pet is extolled - they bring comfort to the elderly and sick, and they teach us something of God through their loving devotion to us. God loves us as faithfully as a puppy. Nice doG-God. Or their lack of intellect is used to show how hard it is for us to understand God’s commands and plans for our life. We are to pets as God is to us. We, after all, are the image of God. Pets as both metaphor for divine love, and for divine control, work only because pets are little more than “flaccid slaves” compared to their nondomesticated ancestors. In heaven there is no room for the Wild Other who steals our babies from our tents, and who reminds us of the wild and untameable God who created us, the God of love and loyalty and pain and death.

Domestic livestock, the other source of Vicar of Dibley-esque “animal services” are similarly pale reflections of wild animals. They are the Other bent into our

---

1047 Ibid.
1049 Ibid.
image. Our experience of God is therefore deficient; because we interact with a
McDonalds-ised God, a mutated and tamed God, a God who relies on us for its
survival. As a result of such an impoverished, easily digestible diet, the “body of
God” has become an obese couch potato.

So it is not enough to call people to love their pets, or be kind to their
chickens. Such love is inherently patronising. It is not enough even to “love”
wild animals or “nature”. Biophilia was not, it must be remembered, only the love
of life, it was the engagement with life,

“… the paradox [is] that primal peoples kept their distance from
animals- except for their in-takings as food and prototypes- and
could therefore love them as sacred beings and respect them as
other “peoples” while we, with the animals in our laps and our
mechanised slaughterhouses, are less sure who they are and
therefore who we are.\textsuperscript{1051}

Gebara points out that our religious symbols, like the lilies of the field and the
breaking of bread, are no longer grounded in the daily reality we experience. This
creates a deeply religious problem for those who continue to use these symbols to
express their faith. We are out of touch with our symbols and the God they
point us to, because we are out of touch with life in all its awesome abundance.
We forget that it is indifferent to us, our desires, even our survival. We lack awe.
A rich Christian spirituality needs, I believe, not patronising affection, but awe.
As Paul Collins puts it,

“… modern ecology is absolutely central to the future of
religion… Christianity specifically will gradually cease to exist
if the natural world continues to be devastated at the present
rate. There is a deep and dependent inter-relationship between
the development of religious attitudes and the sustainment of the
natural world… human beings, living in a feed-lot world where
all wilderness has been destroyed… will slowly lose touch with
the possibility of the development of culture, art, religion, and
spirituality… we human beings will simply shrivel up spiritually

\textsuperscript{1050} Though having chickens in the first place would be a big advance on buying their eggs from
the shop. And battery farming should be abolished immediately, in my opinion, but for the
chicken’s sake - it wont bring us closer to the Wild Other.

\textsuperscript{1052} Gebara, \textit{Longing for Running Water}, p. 197.
and lose our ability to perceive and experience the deeper issues that give meaning to our lives and the transcendent reality that stands behind the natural world and all that is... \(^{1053}\).

I have engaged in a fairly sustained consideration of the biophilia hypothesis, and its theological extension which affirms Earth as sacrament. If used to truly affirm the Wild Other, it further grounds us in the need to engage with life as a whole as the image of God, and reminds us of those parts of the Christian tradition that point us to the wild God beyond us. Yet this sacramentalist view does not feature in the Uniting Church resources I considered in chapter 6 \(^{1054}\).

As we saw in chapter 6.2.4, Uniting Church engagement with creation focuses on seeking justice for creation, based on the declaration that the rest of creation is good in itself, apart for its usefulness to humans. The appeal to preserve biodiversity, then, is not couched in biophilic or sacramental terms,

‘Why does it matter if an insect, a plant, or a bird disappears forever? It matters because each one is a creature who belongs to God. It matters because whenever the diversity of life is reduced the world becomes a poorer place.’ \(^{1055}\).

The problem of the world becoming a “poorer place” has nothing to do with its sacramental usefulness to humans, or our biophilic needs. It matters because it matters to God. Even when creation is said to be eucharistic, as we saw in chapter 6.2.5, the emphasis was on God’s blessing to creation through the eucharist, not the human ability to encounter God through it.

This emphasis on the value of creation for itself and for God is a corrective to the anthropocentric, utilitarian tendencies in sacramental theology identified by

---

\(^{1054}\) The one exception proves the rule, since it comes from an Anglican employed to lecture in a Uniting Church college in Adelaide. It appears in a chapter on the nuclear energy cycle produced for the Assembly in 2000, “Thus the creation is sacramental, being a visible and tangible sign of the invisible and intangible reality of God. Any diminishment of creation, such as the accelerated loss of species, is a diminishment in our perception of the Creator.” (Balabanski, “Theological Foundations for Considering the Uranium Mining/Nuclear Fuel Cycle.”)

\(^{1055}\) Assembly Social Responsibility and Justice Committee, "Healing the Earth," p. 15.
McFague\textsuperscript{1056}. Biophilic sacramental theology focuses on what creation can do for Christians, and how we can thus best preserve our own interests. The Uniting Church dares call its members to a more presumptuous task.

### 10.3 Biocentric mission

As we saw in chapter 7.2, the \textit{Basis of Union} commits members of the Uniting Church to the formidable task of discerning the will of God. It assures us that, through an informed faith, we can know something of God’s ways. We will, it assures us, learn more of the will and purpose of God through contact with contemporary thought, including the sciences. Through relating to those outside the church we can better understand our nature and mission\textsuperscript{1057}.

What is our mission? Why are we here? Why is there something rather than nothing\textsuperscript{1058}? In the section on biocentric process theology\textsuperscript{1059} I argued that life is here to live, to give God an other to relate to, in order to allow God to change. I want to briefly develop that idea further. If God’s desire is for richness of experience, primarily mediated through relationships, if that was God’s “mission” in creating or relating to the universe, then Christian mission should be to enhance the richness of experience of God\textsuperscript{1060}.

Here we go beyond what the science story can tell us, claiming that that the good is that which maximises God’s experience. Yet experiences can be ambiguous, for us at least. We do not ourselves value all experiences. Sex, for example, may be experienced as a moment of love and intimacy, or brutality and violation. The

\textsuperscript{1056} McFague, \textit{The Body of God : An Ecological Theology}, pp. 183ff.

\textsuperscript{1057} Uniting Church in Australia, \textit{Basis of Union}, section 11.

\textsuperscript{1058} Most Christian theology, in the west at least, subscribes to the doctrine of creation \textit{ex nihilo}, that without God’s action there would have been no creation. Catherine Keller (Keller, \textit{Face of the Deep},) argues persuasively that this is not the biblical world view, and should not be our world view, recalling Genesis 1:2, where the Spirit of God broods over the \textit{pre-existing} deep. She still assumes that God \textit{did something} through which the deep brought forth life as we know, so we can still ask the question, why?

\textsuperscript{1059} Chapter 9.5, page 42.

\textsuperscript{1060} Lucy Larkin promotes this idea, from a slightly different perspective (Larkin, “The Relationship Quilt,” p. 157.)
dying process can be a peaceful, welcomed one, or a terrifying assault to be desperately resisted.

Informed by ecofeminism we might imagine that God affirms in general the experiences of death and pain, tragedy and suffering, but not all of them specifically. Even a specific instance of joy might not be automatically affirmed if it comes at great cost to others, and therefore at great cost to God\textsuperscript{1061}. So we will need to make judgments about what sort of experiences God values. Whilst admitting the folly of trying to read the mind of the God of the universe, we don’t seem to have any alternative if we wish to do something rather than nothing.

And here the Christian claim that in Jesus of Nazareth we see something of God’s communication to humans gives us a little more confidence in our endeavour. Here then is another assumption which we cannot claim to justify from the science story; that the story of Jesus in some way reveals something of the divine will, for 	extit{H. sapiens} at least. At a bare minimum the Christian claim is that in Jesus we see a special divine communication to humans about how we should be in the world. Alongside the Genesis tradition of humans being created in the image of God lays the New Testament claim that amongst humans, Jesus is in some way a unique image of God, indeed the image of the invisible God\textsuperscript{1062}. This includes both the sense of Jesus having a unique relationship to God as the firstborn (most important) of all creation\textsuperscript{1063}, and also being the likeness of God, the latter especially in the gospels\textsuperscript{1064}.

So Christians have two images of God: the billions of years old pulse of life, and the historical man Jesus of Nazareth, who lived for approximately thirty years.

\begin{flushright}

\end{flushright}
two thousand years ago. What might the first image contribute to our understanding of the second image? What does it mean to say that Jesus is the unique human image of God, and is that actually tenable anymore?

### 10.4 Jesus the image of God

To claim that Jesus was the unique human image of God says little in some respects. Arianism, Adoptionism and a number of other famous heresies would happily make that affirmation. Classical liberalism, exemplified most publicly by Samuel Angus\textsuperscript{1065} and Ted Noffs\textsuperscript{1066} in the pre-uniting churches, accepted that Jesus appeared to be the unique human image of God, but claimed that in principle anybody who opened themselves to God could also be that image, since we were all of the same substance as Christ.

The majority Christian tradition, however, emphasises that Jesus of Nazareth not only \textit{was} a unique image of God, but necessarily \textit{is} unique. No human can win the possession of that image through their own efforts. We cannot become a child of God directly, but only through Jesus, the unique child of God. This coheres well with my rejection of consciousness-telism, which is implicit in liberal theology for example. If it is through our own conscious efforts to transcend ourselves that we may also become the image of God, then many humans, and most animals, are excluded.

Biology opens up a fantastic alternative\textsuperscript{1067}. Perhaps Jesus had a genetic mutation, which gave him the ability to perceive God’s constant communication with the world more fully than the rest of us. Some animals can see the infra-red, ultra-violet, and even ultra-sonic worlds, and Jesus could literally ‘see’ God. Since Jesus did not breed\textsuperscript{1068}, the ability perished. He was then, the unique image of

---

\textsuperscript{1065} Ian Breward, "Christianity Must Be Reinterpreted; Samuel Angus' Response to a Secular Society and a Traditional Church," \textit{Trinity Occasional Papers} 4, no. 1 (1985): p. 27.

\textsuperscript{1066} Ted Noffs, \textit{By What Authority?} (Methuen, 1979), pp. 28-31.

\textsuperscript{1067} Literally fantastic, not necessarily good.

\textsuperscript{1068} A tiny minority believe that he did. However, his life suggests that enhanced communication with God is strongly linked to increased mortality, so we would not expect the mutation to persist for long.
God in a way we cannot hope by our own efforts to replicate. Of course, we would expect the mutation to repeat from time to time. In the right environment, this mutation may again lead to a manifestation of this unique relationship with God. This line of thinking holds potential for those who want to affirm the autonomy of other faiths, though I expect the idea that Jesus, Buddha and others shared a common genetic mutation is too bizarre to ever be pursued.

The majority Christian tradition affirms not only that Jesus was unique, but that he was unique because of the action of God. Jesus was not just a man who lived uniquely well or a genetic freak; but the fusion of the fullness of God and fullness of humanity in a single individual. This image can only be repeated if God wills it to be. Jesus was the image of God, then, because God intervened in the biological world to make it so.

The interesting question in this thesis is to whom does Jesus image God?

Eco-engaged theology, in its desire to value all creation, often claims that Jesus came to bring salvation or redemption not just to humans, but to everything. A key strategy in affirming all creation is to link it to the incarnation. Jesus is not just human, but flesh. This is a major emphasis of McFague’s body of God metaphor, and in chapter 6.2.13 I showed that Bos and James took this

---

1069 This to, of course, opens the door to religious pluralism.

approach. John Davis, when a candidate for ministry in the Uniting Church engaged in a sustained argument for this way of thinking. For Davis, “humanity is merely incidental to the incarnation,” and the fact that,

“…the grace of God was imminent in creation before human existence, and will continue beyond human existence, necessitates an attitude towards the cosmos which cannot be anthropocentric.”

Not only that, but the incarnation, the centre of Christian faith,

“…can not be construed as anthropocentric or androcentric. God gave God’s self to creation (emphasis mine).”

Gebara agrees that all creation is caught up in the saving work of Christ, begun in the incarnation and testified by the resurrection,

“… it is the earth that is both the subject and the object of salvation. We need to abandon a merely anthropocentric Christianity and open ourselves up to a more biocentric understanding of salvation. To Jesus’ humanistic perspective, we need to add an ecological perspective. This new way of doing things seems to me perfectly justified, because it maintains not only the most fundamental aspects of Jesus’ perspective, but also the understanding that we are a living body in constant evolution (emphasis mine).”

Though Davis and Gebara explicitly reject anthropocentrism, the attempt to include Earth in salvation actually works best when grounded in the anthropocentric tradition, which sees Jesus the Christ, the God-human, as the second Adam, the one sent to save us from the consequences of the Fall. This is a tradition which grounds itself squarely in the Pauline reflections on the relationship between Adam and Christ.

---

1073 Ibid: p. 45.
1075 The documentation of the development of the doctrines of Original Sin and the Fall is undertaken extensively by Wiley (Wiley, Original Sin - Origins, Developments and Contemporary Meanings,) and Korsmeyer (Korsmeyer, Evolution and Eden.).
“For since death came through a human being, the resurrection of the dead has also come through a human being; for as all die in Adam, so all will be made alive in Christ.”

Therefore, just as sin came into the world through one man, and death came through sin, and so death spread to all because all have sinned…

Yet creation is not spiritually fallen, and finitude is not a consequence of a Fall. Finitude is good. What sense can we make of the idea that Jesus saves creation? From what does he save it, if not pain and death? I believe that Jesus’ role in creation must be thought of as a secondary one, resulting from his role amongst human beings. Having stressed that God’s relationship with creation is a direct one, not mediated by God’s relationship with humans, I will now argue that the event which Jesus of Nazareth represents is in the first instance a God-human story. Jesus as God-human, ironically, preserves a biocentric worldview better than the idea that Jesus is God-flesh. Jesus is only directly the Christ for humans.

Edwards, though hardly a biocentric theologian overall, provides a way of conceiving the link between Jesus and humans in the context of the relationship between God and creation,

“.if Jesus Christ can be thought of as the human face of God in our midst, the Spirit can be thought of as God present in countless ways that are far beyond the limits of the human…. God is given to us in a personal presence that exceeds all human limits.”

So Jesus came for humans, to save us. Does this offer of salvation call us into, or out of the evolutionary story? To participate in or overcome it? What do we

---

1076 1 Corinthians 15:21-22, NRSV translation.

1077 Romans 5:12, NRSV translation. Crucially, the italicized text was long mistranslated as “in whom,” which had a major impact on the development of the doctrine of original sin. See Wiley for more on the mistranslation (Wiley, *Original Sin- Origins, Developments and Contemporary Meanings*, pp. 51-52.) She examines the uses of this verse in Christian history throughout her book.

1078 Edwards, “For Your Immortal Spirit Is in All Things,” p. 65. His reflections on the possibility of multiple incarnations if there are multiple intelligences throughout the universe supports the limitation of Jesus of Nazareth’s person and work to humans.

1079 We hear the echoes of Richard Niebuhr’s classic (H. Richard Niebuhr, *Christ and Culture*, [1st ] ed. (New York,: Harper, 1951).)
need to be saved from in the first place, or what do we need to have revealed to us? Are the consequences of this salvation or revelation limited to humans, or do they flow on to the rest of creation in a secondary sense? What does it mean to be saved amidst the affirmation of our individual death and communal extinction? And is there any hope that our attempts to live out our salvation, or the revelation we have received, might succeed?

The emphasis in ecotheology that Jesus did not come to save us out of the world could still be true even if it no longer makes sense to say that he came to save us with the world. But if he has not come to save us from the Fall, or even from the finitude which we traditionally took as evidence for it, then what has he come to save us from, and why?

One possible answer is that he came to save us from the fear of finitude, or at least being controlled by that fear to the extent that we no participate in life. If we do not participate fully in life, we have impoverished relationships, and so God’s relationship with life is diminished. Jesus may be different not in being “perfect” (a notion with little ecological or evolutionary meaning), but in accepting death, even violent death, so as to enter into life. Certainly his challenge to those who would follow him, as we have it recorded in the gospels, frequently refers to the need to accept finitude in order to participate in eternal life, especially finitude deliberately inflicted by others. Yet his was not a morbid life. He did not pursue finitude but he did not hide from it either. This enabled him to embrace life in all its fullness, and that is what he offered to those who came to know God through him.

Jesus’ mission would then be to call humans to embrace our finitude in order to participate in life, to have full relationships which God can vicariously enjoy, and to have a full, direct relationship with God. In other words, Jesus came to call us back into the evolutionary story of life.

---

1080 Of the numerous examples in each gospel, see for example Matthew 5:10-12; Mark 10:29-31; Luke 14:25ff; John 12:24-25.
Of course, fear of finitude is not always a bad thing. It is perfectly reasonable and highly adaptive to be afraid when harm is an immediate possibility. It would never have evolved otherwise. The fear which requires salvation is the chronic, overwhelming, fear of finitude which prevents us engaging fully with life, and causes us to inflict harm on others in order to hide from it. This level of chronic fear is only possible for those who are conscious, probably even self conscious; so we would expect the potential for it to have slowly grown over the last few million years, amongst primates and possibly cetaceans.

If the potential for this chronic fear has existed for millions of years, why did God leave the incarnation so long? Just because the biological potential existed does not mean that it actually occurred. Human brains have changed little in over 100,000 years, yet what we think about has changed enormously. This chronic fear of finitude may be a relatively recent event. It is not even clear that this fear is a problem for all humans today, a point I will elaborate on in chapter 10.6. For now, though, I want to consider why God intervened in human history at all- why did God become one with our human flesh?

For one thing, Jesus came for humanity’s sake. Jesus’ central message as recorded and expounded by his earliest followers was that God loves humans. This is what gives us the confidence to embrace our finitude. How it gives us this confidence might be along the lines proposed by Clark. She argued that what we primarily fear is the lack of either bonding or autonomy. Since they pull us emotionally in different directions, we need to be able to make sense, or meaning, of our inability to have both. If this is missing, or if we simply lack one or the other outright, then our finitude overwhelms us. Belief in God and the great biocentric story of the universe might answer the need for meaning, as we balance our sense of bonding and autonomy not only from each other, but from the other creatures around us, indeed from God. Perhaps the fear of finitude is greatest when we think it will make us overly dependent on others, or abandoned by them.

Equally, for the sake of other creatures. If we see current human action as mostly evil, then Jesus came for the sake of those creatures whose habitats are being destroyed as we seek immortality, or at least distraction, through consumption and
control. He becomes the Jonah sent to warn humans of the consequences of our godless ways, or the Lorax who speaks for the trees\(^{1081}\). Here we reconnect again with the vast body of ecotheology which, for whatever reasons, calls on us to limit our consumption of resources in order to make more available to the rest of life on Earth. God acts to save creation, not by changing its nature but by limiting the ecological impact of humans within nature. God does not need to save other creatures from the fear of finitude, it usually only concerns them when it needs to\(^{1082}\). Animals are saved in a secondary sense, from the unnecessarily prolonged fear of finitude imposed on them by fearful human systems. For example, the domestic livestock who are crammed into slaughter yards, trembling fearfully amidst the sounds and smells of death which they know intuitively spell danger for them\(^{1083}\).

If we see the human mediated extinction as good, then we might imagine that God intervenes for the sake of those who will profit when we embrace our eventual extinction, and we hear especially Jesus’ calls to renounce our lives in order to participate in eternal life. To lay down our (species’) life for those friends yet to come.

Finally, perhaps pre-eminently, God did it for God, whose experience of life includes the vicarious experience of life through creatures, and who would thus experience less fear and more joy if we escape or at least minimise our fears.

This line of thinking obviously implies that the incarnation of God in Jesus of Nazareth may not have happened, something which Christians have disagreed on through the ages. Had humans not fallen into chronic fear, there would be nothing to save them from, thus the incarnation depends on human action, not God’s

\(^{1081}\) “My name is the Lorax, I speak for the Trees. I speak for the trees since the trees have no tongues...” Theodor Seuss Geisel (Dr Seuss), *The Lorax* (not stated: Random House Books for Young Readers, 1971).

\(^{1082}\) Peacocke, ”The Challenge and Stimulus of the Epic of Evolution to Theology,” p. 101.

\(^{1083}\) I believe that slaughter houses are not only economically efficient, but they are popular because they shelter most of us from the reality of death. We cannot even kill our dogs, but have them “put to sleep.” Professionals in hospitals, hospices, funeral homes and crematoriums take care of death for most westerners.
completely free initiative. One response is that there is nothing to stop the incarnation happening for a different reason, just because God felt like it. In the wider context, though, I have already argued that the evolution of humans in the first place was highly contingent. Had a few things gone differently the most self-conscious species on the planet may not even be mammalian. There may not even be a self conscious species. Since human evolution is contingent, so must be the birth of Jesus of Nazareth, and thus the specific incarnation which launched Christianity.

It did not need to occur, but Christians claim it did. I suggested above that it represented God calling humans back into the evolutionary story of finitude and contingency. Yet this is not a common view even in ecotheology. Christianity is often seen to be a fight against our “selfish” evolutionary history, a counter-evolutionary force. As examples of this thinking I will consider the ethical visions of Sallie McFague and Rosemary Radford Ruether. I focus on them because of their undeniable influence in the field of ecotheology and ethics. McFague has quite an ambiguous view of death. Radford Ruether, like a number of other ecofeminists, is unreservedly affirming. But both seem to envisage the ethical project as something counter to the evolutionary history of Earth. I will try to show that their fundamental concerns for justice can be addressed within an evolutionary framework, and then speculate as to where we might expect these ethical systems to actually work.

10.5 Jesus against evolution?

In chapter 8.2.5 I decided in favour of the Darwin/de Waal understanding of the evolution of ethics over against the Huxley/Dawkins one, where evolution is seen to be a selfish process, creating instinctively selfish creatures. It is the latter framework which dominates popular thinking, and not surprisingly theological responses to the theory of evolution tend to respond to this view of evolution and morality. So, within the Uniting Church we have Professor Rod Rogers, a biologist, who argues that,

“… we are born selfish, selfishness has shaped us to the point where we have the intellectual facility to recognise selfishness and escape from it.”

Charles Birch initially sounds like he has escaped this trap when he recognises that,

“Neither our nature nor culture is bad… It is too easy for us to say we are victims of our genes or victims of our environment.”

Yet his main thrust, relying on Huxley, is that our nature is indeed selfish, and we need to, “… outfox what evolution has led us to (emphasis mine).” Theologically, Birch criticises the version of Original Sin which he traces from Augustine through Luther and Calvin. He shows how it parallels the notion of genetically embedded selfishness. He also correctly contrasts Augustine with Pelagius, whom he seems to favour. It would seem logical, then, for him to rely on Darwin and Frans de Waal, rather than Huxley and Dawkins for his scientific explanation of the links between genes and temperament. Since de Waal is not mentioned by Birch it appears that he was, unfortunately, unaware of his work, and thus a more satisfying and scientifically correct vision for ethics. When McFague and Radford Ruether claim that Jesus’ ethic is counter-evolutionary, then, they stand within the theological majority.

1086 Birch, Biology and the Riddle of Life, p. 87. This concludes a lengthy section on the issue, which started on page 78.
1087 Ibid, p. 80.
McFague’s misunderstanding of the nature of the evolutionary process is revealed when she claims that we can counter natural selection with the principle of solidarity. As a result, “… the physically challenged are not necessarily cast aside as they would be if only genetic selection were operative.” She believes that we have replaced biological with cultural evolution, where we can prioritise a desire for all life forms to share the basic good of the planet. This, “solidarity of each with all” is, she believes, counter to the workings of natural selection or the survival of the fittest. Because she is ambivalent about death, she wrestles with the possibilities for justice in a world of natural selection, which leads as she sees it to the natural evil of death and suffering.

We need to correct the idea that anything can counter natural selection. It will always occur. Solidarity is a practice which natural selection “judges” according to its biological consequences, it is not something which can operate “against” natural selection. Clark has explained how individuals who practiced reciprocal solidarity with others in their small group were selected for during the ice ages in our recent history.

The contrasting of solidarity with survival of the fittest also reflects a common misunderstanding of that unfortunate term. The “fittest” are not to be contrasted with the “weakest”, like the physically challenged McFague mentions. The “fittest” are those who best fit their environment, measured by the extent to which they survive to breed, and/or care for offspring who share their genes. The

1089 Ibid.
1091 Ibid, pp. 170ff.
unit of selection is not even so much the individual as their genes. Genetic selection does not “cast aside” the physically challenged, but if there is a genetic basis for their condition, and if it is severe enough to prevent any carriers of the gene from breeding, and from caring for others who are otherwise closely genetically related, then selection will tend not to favour the ongoing survival of the genes that code for it.

In claiming that Christianity is counter cultural when it promotes the inclusion of the excluded and weak, we need to remember that McFague is writing primarily against western industrial cultures. Such cultures do indeed marginalise and cast aside, and they could afford not to. It has been shown, however, that in other less technological cultures, with smaller numbers, where people know each other, there is a strong tendency to care for the injured to a point. This predates H. sapiens - it is known that Neanderthals took care of their sick and injured as do other primates. Indeed, many social vertebrates tend to do so, within their means. Elephants, for example, have strong social bonds and display high levels of altruism. There are limits, even in human societies, and the limit generally appears to be about survival. Infanticide, for example, was necessary for survival in Australian nomadic communities in times of scarcity, as mothers adjust their maternal effort to their circumstances.

Is that, we might ask, really an evil? Are individuals in such circumstances really called to lay down their life in the place of the frail elderly, or the infant? Is it really unfair that some are left to die, if all have an equal chance of being that somebody? The more death affirming ecofeminists like Radford Ruether might say no.

---

1097 Hrdy, The Past, the Present, and Future of the Human Family. Hrdy points out that the more support the mother has from others in her group, the less likely abandonment will be.
Ruether embraces death and pain and suffering; but rejects their unequal and therefore unjust distribution. It is not that people die that is evil, but that some people, in trying to deny their finitude, construct systems of domination and distortion\textsuperscript{1098} which make others suffer and die more quickly than they ought, “Sexism and all forms of exploitative domination are thus not parts of the image of God, but forms of sin.\textsuperscript{1099}”

This is a compelling vision of human communities. If the image of God is confined to \textit{H. sapiens}, this statement may provide a practical ethical starting point. It calls people to share resources so that all have an equal chance at a fulfilled life, even though that life will involve pain, and one day come to an end. But if the image of God is \textit{life}, and humans are part of the evolutionary process, we seem to face a major dilemma.

For a central claim, if not the central claim, of evolutionary biology is that it is the unequal distribution of resources, the shortage of resources, and the differential successes of organisms in exploiting them, that makes some individuals more likely to survive, and thus fuels natural selection. Only by claiming that human biological evolution has stopped can we claim that the unequal sharing of resources is fundamentally evil, and then only for humans. Only an ecology divorced from evolution can imagine that a good world is one in which all creatures have enough. Yet even then we would need to acknowledge that exploitation is an essential part of ecology, and a major component of many ecological relationships. Life forms use life forms. Parasitism is a major life strategy. Every organism relies on, and often precipitates, the pain, death and even suffering of others in order to survive.

What we might affirm is that evolution proceeds, and thus ultimately God’s richness of experience is enriched, when \textit{all} organisms are subject to exploitation (use by others). Many organisms use technology to attempt to maximize their

\textsuperscript{1098} Ruether, ”Ecofeminism: The Challenge to Theology,” pp. 105-06.

\textsuperscript{1099} Ruether, ”The Future of Theology,” p. 251.
resource exploitation and minimize their chances of being exploited\textsuperscript{1100}, but most of these technologies have very limited effectiveness. Some humans, however, have managed through technology to greatly increase their exploitative potential, whilst insulating themselves from being exploited, including delaying their deaths through various technologies. Even when they do die, some hide deep in the ground in coffins, thus denying the soil microbes, and thus the trees and animals, access to their bodily resources for decades, or even permanently. Cremation is even worse - destroying many useful organic materials and consuming vast amounts of energy\textsuperscript{1101}. An expression of sin, then, might be the removing of the self from the cycle of exploitation on which life, and thus God, depends.

As for domination, ecologists often talk of dominant species, those whose activity in a particular ecosystem has a major impact on other species, larger than their numbers would lead us to predict. On ecological time scales, such species sometimes sow the seeds of their own destruction, by manipulating their environment to the extent that they are no longer suited to it. On evolutionary time scales, the demise of dominators is often due to external factors. So again, a rich image of God, over a long enough time scale, requires domination, but also requires the dominance of any one species to be ephemeral. Sin, then, may be use of technology to block this ephemerality.

So Radford Ruether says that individuals must embrace their finitude, and justice is achieved when we share equally in that experience. Since finitude often results from the actions of others, I am proposing that justice is an equal sharing in the experience of being exploited and dominated, rather than escaping the experience altogether. This does not mean that we expect people to have an exploitative and dominating attitude. Rather, natural selection will “choose” between individuals and communities based on the extent to which their attitudes lead them to

\textsuperscript{1100} For example apes use sticks to remove termites from mounds, thus increasing their ability to exploit the termites. Many creatures construct nests and even stone shelters to reduce their chances of being exploited by others for food.

\textsuperscript{1101} When I did my postgraduate diploma in environmental studies one of the masters students was measuring the relative environmental impact of different methods of human body disposal. She told me that cremation was easily the worst, and shallow burial, naked or in cotton clothes easily the best. If you choose the latter, it is worth including a non-biodegradable note with which to allay the concerns of police.
effectively exploit and dominate the resources around them. Some communities will choose to care for their sick and old, others will not. Some will be highly individualistic, others very communal. None of these strategies oppose natural selection, all will be “evaluated” by natural selection, according to which aid the survival of the community in their environment, and ability to respond to changes in that environment as they occur.

Yet we know that evolution proceeds in a somewhat punctuated way. It is during times of massive environmental flux, especially when populations are isolated from each other, that the most rapid evolution occurs. Here technology creates a paradox. On the one hand, the use of human technologies produced massive changes in ecological conditions. On the other hand human technology allows those who possess it to survive these same changes, at least for several generations. Technology buffers actions from consequences. Secondly, while technology allows humans to travel the globe and thus reduces cultural and biological isolation, there is an increasing gap between those who have and do not have access to technology, which effectively produces class based, rather than geography based isolation.  

Of the many things I could attempt to engage with at this point, I want to highlight the heterogeneity within the species Homo sapiens, based not on genetics, but access to technology. This leads to a biocentric ethic which fits within, rather than standing against, our evolutionary heritage, and which avoids the widespread slide from biocentric theology to anthropocentric ethics.

10.6 Jesus’ ethic: “human versus creation” to “rich versus poor”

In order to ground ecotheology in a central message of Christ, McFague attempts to reimagine nature as the new poor. She also points out that the human

---

1102 Reproductive isolation is a major catalyst for speciation. Overlaid on this is the relative freedom of cultural ideas and behaviours from genetics, and the rapid evolution of these elements (popularly referred to as memes) across biologically stable human populations.

species contains within it both rich and poor people\textsuperscript{1104}. Despite this, she maintains a clear distinction between the human and non-human poor, so her ethic remains determinedly anthropocentric\textsuperscript{1105} despite her claims to the contrary. She criticises deep ecologists for claiming that humans are but one species amongst many, and is emphatic that, “… our own species must be first in consideration and importance (emphasis mine).”\textsuperscript{1106} She goes on to contrast the plight of a starving human child with starving animals, and argues that unless we uphold the needs of the child we are widening the gulf between social and environmental activism\textsuperscript{1107}.

Ecologically, it is not simply membership of \textit{Homo sapiens} which dictates one’s impact on the systems of Earth. It is not differences amongst humans in their genetic makeup which determines their ecological relationships, but differences in their access to and use of technology. It is technology which allows some humans to be such effective dominators and exploiters, and escape the consequences in the short term. History suggests that few human civilisations persist for more than a few hundred years once they develop technology\textsuperscript{1108}, and that their neighbours which are put in range by that technology persist for even less time\textsuperscript{1109}.

It is not the extinction of \textit{H. sapiens}, then, which is actually the most ecologically significant event in the future, it is the removal of the technology which enables some to be so resource rich. At this point in our evolutionary story, this category includes \textit{only} humans but it does not include \textit{all} humans.

\textsuperscript{1104} Ibid, p. 4. Throughout the rest of the book she often fails to uphold this, however, often speaking of all humans as “we.” (eg pp. 105, 108-110).

\textsuperscript{1105} Kwok Pui-Lan also criticises McFague on this point, and McFague’s claim that Jesus has little to say directly about other creatures (Kwok Pui-Lan, "Response to Sallie McFague," in \textit{Christianity and Ecology : Seeking the Well-Being of Earth and Humans}, ed. Dieter T. Hessel and Rosemary Radford Ruether (Cambridge, Mass: Harvard Univ Pr, 2000.).)

\textsuperscript{1106} McFague, \textit{The Body of God : An Ecological Theology}, pp. 116-17.

\textsuperscript{1107} Ibid, p. 117.

\textsuperscript{1108} Diamond provides a very useful, short summary of the ecological collapse of human societies (Diamond, \textit{Ecological Collapses of Pre-Industrial Societies}.) The low technology Aboriginal nations in Australia survived in some form or other for tens of thousands of years.

\textsuperscript{1109} Ruether summarises the collapse of empires and those they conquered around the Mediterranean (Ruether, \textit{Gaia & God : An Ecofeminist Theology of Earth Healing}, p. 173-87.). The rapid collapse of the Aboriginal nations in Australia is recent example.
Not all humans are technologically or ecologically equal. The agencies of the Uniting Church which deal with humans have repeatedly called attention to, and sought to redress, the widening gap between rich and poor, oppressive and oppressed, in Australia and the world. Uniting Church ecotheology, however, speaks of humans as an all inclusive “we,” and thus loses much of its prophetic potential. To lump an oppressed Indigenous population in with its oppressors, or landless peasants in the Philippines with Bill Gates, has no defensible basis now that we have rejected the ontological distinction between humans and other animals. When we combine the critique of wealth with the critique of anthropocentrism we are better placed to approach ethics biocentrically. Even if McFague is right, and Jesus had little direct concern for the plight of non-humans, his teaching still has much to say to his followers today, given his preoccupation with critiquing wealth and power, and those who possess it. Rather than a simplistic call to all humans to better exercise their divinely appointed stewardship, the rich among us are confronted with the challenge of Christ, who placed himself in solidarity with (as opposed to patronising benevolence towards) the poor.

Life as the image of God allows us to see the basic connection between landless peasants and the animals around them, suffering at the hands of the rich and powerful humans who exploit them. The false distinction between social justice and ecological justice disappears. We see that the main ecological dynamic on Earth at the moment is that between the resource rich and poor, the latter including most humans and most other animals.

---

1112 Well treated stock, for example, are relatively resource rich, as are most species whom humans consider vermin, such as rats and cockroaches, whose population levels have exploded commensurate with human populations.
A theology which seeks to enrich God’s experience of life, then, is called to embrace the radical *humbling* of humanity, not its extinction. The eventual extinction of humans will not remove pain, suffering and death from the planet, any more than our appearance precipitated it. There is no pre-human Eden for the rest of life to return to after our passing. Biocentric theology hears the echo of the one who called his followers to humble themselves in order to participate in Life, who, according to the records we have, spoke more about the perils of hoarding resources than anything else.

But can it ever work? Let us suppose that despite all the unknowns about the ultimate impact of human mediated extinction, we decide, in the interests of furthering our own spiritual quest, to love God. We decide that to follow Jesus’ ethic of wealth, interpreted for our day, is a good thing. Could whole societies ever actually follow the teaching of Jesus? I must confess to being sceptical that high technology societies could achieve this; based on the historical evidence of the relationship between technology and humans. Jesus’ near obsession with the dangers of wealth gives Christians further cause to be sceptical. Is there, then, any context in which his ethics, or his vision might prevail?

**10.7 Bioregional ethics- where might ethics “work”**

Dutney points out that Jesus never said his ethic *would* prevail. Christians are not called to do what works, but to do what they do because of what God is like, because the reign of God has come near. Luke tells us that Jesus called us to be merciful because that is what God is like, not because we will be better off if we do. The call of Jesus was not to love our neighbour, but to love our enemy. This includes those who consciously and unnecessarily seek to harm, even kill us. It surely then extends to those who consciously seek our demise out of necessity, such as the lion. And even more so those who unconsciously assault us, from

---

1113 Dutney, *Love Your Enemies.*

1114 Luke 6:36, “Be merciful, just as your Father is merciful.”
annoying mosquitos to deadly parasites and microbes. What does turning the other cheek mean in this context?

Jesus’ ethics may have been impractical, but Walter Wink believes he also taught a practical way of resisting being treated unethically, a way of resisting exploitation. In turning the other cheek and going the extra mile Jesus was teaching us to confront and upstage those who exploit us\textsuperscript{1115} with a minimum of violence and danger to ourselves. This could, very playfully, condone our swatting of mosquitos, using an open hand rather than a backhanded slap.

Is there any hope that communities which act graciously towards all life, whilst resisting the ungracious actions of others, could survive? Can Christian communities really exist?

It seems reasonable to think that Jesus’ ethic might be most possible for those to whom it was addressed; small communities of technology poor, relatively communal humans surviving in a challenging environment. That environment could be an exploitative high technology society, or “wilderness.” Jesus’ ethic is in a sense a call to those small communities to return in some way to the practices of the pre-technological communities from which we evolved. A call to attempt to re-enact those small Pleistocene-like communities in which all shared equally in the likelihood of joy and pain, birth and death. In other words, Jesus might be calling his followers back to embrace the pattern and ethic which comes directly out of, rather than opposing, human evolution. Might this be the best, even the only, context in which his ethics “work”? They certainly seem to have had little effect in large high technology societies\textsuperscript{1116}.

\textsuperscript{1116} I write this in the last days before the 2004 American election, where high profile Christian leaders like Jerry Falwell saying, “I’m for the president to chase [terrorists] all over the world. If it takes 10 years, blow them all away in the name of the Lord.” (http://www.sojo.net)
This may be because it is impossible to actually have an ethical system where one’s actions are divorced from the consequences, and this is exactly what technology achieves, at least over the time scale of human generations. The smaller and lower technology a group, the less divorced the individuals are from the consequences of their actions, both socially and ecologically. Dutney’s claims that Jesus calls us to imitate God, rather than do what is practical, must be tempered by Jesus’ repeated assurance that there were consequences for our actions. How hard it is for the rich to enter the kingdom of heaven! We are to renounce earthly wealth to gain heavenly wealth.\textsuperscript{1117}

The biological material through which our ethical systems emerged (primarily our brains), evolved within small groups of socially organised animals. Our ethical systems gained complexity as our brains did. Reciprocal altruism appears to be the genetic basis by which ethical and proto-ethical organisms survived. We might expect, then, that social constructions in which reciprocal altruism, consciously pursued or not, is possible, are likely to enhance the pursuit of ethics. In other words, we need small, relatively stable communities whose technology does not allow them to exploit the resources of others without having to engage socially with them. It may be possible to set up such communities within existing, high tech societies, though it would come at considerable cost. The early Christian communities discovered this,\textsuperscript{1118} as have the many Christian intentional communities which have come and gone since. It would appear, however, to be a minimal requirement for any ethic if it wants to escape the need to constantly cut across the very valuable moral mores we have evolved over the millennia. The choice appears to be between being immoral (even if only because we are caught up in an immoral system), or being poor.

\textsuperscript{1117} There is an enormous literature about whether this reward was seen by Jesus to be a post-mortem reward, or participation in a present reality, renouncing a wealthy life to find real life. All we need accept is that there were consequences of the decision to imitate God or not. There is also the doctrine of grace, which contends the opposite, that God treats us not as we deserve, not as consequences would predict, but as God freely decides to. The tension between grace and justice/consequences fills Christian literature. In a biocentric theology with no hope for a post mortem life, eternal life must be something available now. Grace sounds somewhat like contingency, though the latter can have negative as well as positive surprises.

\textsuperscript{1118} Schweitzer points out that the Jerusalem church, whose rich members apparently sold what they had to share with their poor members, soon went broke and had to beg money from the churches which Paul, with his economic pragmatism, founded (Schweitzer, \textit{A Place for Revelation}, p. 61.)
So an ethic which minimises its discord with our evolutionary past requires a movement towards localised living, where cause and effect are joined, learning to live in such a way whilst knowing that most people will not. Such groups will not simply be left alone by the more technological system in which they are immersed. There will inevitably be a constant systematic tendency for the surrounding society to remove resources from the smaller group. What, then, to do?

One possibility is to accept the situation, to embrace social poverty and even biological death as the precondition for eternal life (either now or post-mortem). Such communities would, by definition, be short lived unless they could evangelise others to their cause. But evangelism requires contact with others…

Some therefore seek to share resources with other like minded groups, to build a power base with which to resist exploitation whilst proclaiming their message. But as such power is acquired, and the groups become resource rich, they become both more desirable targets for exploitation, and more like the societies they are trying to resist.

One could attempt to render the surrounding system’s technology impotent, forcing its members to be accountable. Thus the various projects for revolution which at their best seek to impose democracy on technologically hierarchical societies. Again, such actions usually require significant technology to be effective, and thus rarely if ever achieve their ideals.

Accepting that there is little hope of prevailing in any way in direct confrontation against technological systems, others attempt to create geographic barriers that minimise the system’s ability to exploit the group. Various movements in Australia have attempted this since the founding of the colonies. Increasingly, however, this is only possible for those who have profited enough from the system to be able to purchase land at its current inflated prices. Australia has a lot of very remote land, but all of it is claimed by somebody, and the inland areas only ever supported small, nomadic populations. Most eco-communities desire to be settled
on arable land, which requires reasonable proximity to the coast. Sprawling suburbs eventually force up land prices and rates to the point where small communities of cash poor subsistence dwellers are forced out\footnote{In Australia, Grassroots magazine often contains stories of those struggling to make ends meet after moving to their “self sufficient” block of land. This problem has been long acknowledged, both in Australia (Mary Moody, \textit{The Good Life} (Sydney: Lansdowne, 1983), pp. 12-14.) and abroad (John Seymour, \textit{The Self-Sufficient Life and How to Live It}, 2nd ed. (New York: DK, 2003), pp. 290-93.).}. Escape, defence, parasitism. Ecology has a lot to teach us about the wheres and hows of communal living, from how to grow food to where to locate ourselves when we try to do so. Is there any hope that these small ecological communities will again become typical of human existence, rather than rare exceptions? That their somewhat apocalyptic lifestyles will become mainstream? That the rich will escape or renounce the dis-ease of wealth and the technology they use to get it?

Many seem to think so. Ecotheology is replete with calls to humanity to use our technology for good, to help us walk lightly on the Earth and share, rather than hoard, resources. I must confess to being more sceptical, and I believe this to be an area where the scientific stories of life and Jesus’ teaching are fully consonant. I want to emphasise that it is the possession of technology, not something inherent in the people who possess it, which is the problem. There are no “bad” and “good” people. Humans with technology can be thought of as being infected with some sort of virus, and those without it are largely those not yet exposed to it, while a minority are those who have successfully developed immunity.

Technology’s closest biological parallel is a parasite: it needs a host to reproduce and function\footnote{There is much speculation, of course, that technology will eventually become self replicating and therefore more like a bacteria, independent of any human host.}. It manipulates its host’s behaviour to enhance its prospects of reproduction. It mutates rapidly and therefore keeps it host constantly vulnerable to new infections (witness the rapid uptake of flat screen televisions and DVDs, and the endless purchase of new mobile phones to replace perfectly adequate ones). It is partly symbiotic, in that it confers some advantages to its host: high technology humans live longer than low technology humans, and their offspring
are likely to survive longer too. Yet, since its method of reproduction differs from its host, in other ways it reduces its host’s reproductive potential. High income, high technology families have less children. Resources which might have been put into successful reproduction by the host are diverted into reproduction of the parasite. Dawkins also points out that the earlier the parasite enters the host, the more effectively it can manipulate its developmental behaviour. It brings to mind a past Adbusters campaign, in which we gaze over the shoulder of a young child, who sits mesmerized in front of a television set. On the back of his neck we see a barcode, and beneath the photo is the by-line, “The product is you.”

Bar codes were consistently linked to the number of the beast, which preoccupied those in the Pentecostal church I attended as a new convert, and the many guest speakers who came to warn us of the coming apocalypse. Instead of humans possessing technology, perhaps we should think instead of certain humans being possessed by technology. The rich, then, are not evil, but victims. They are possessed by the Enemy. Christian tradition has long and often spoken of Jesus as the one who came to save those who were possessed. Dare we imagine that it is the rich, not all humans, who need to be saved in the primary, or direct sense?

Jesus came to set them free from their possession, a possession he successfully resisted in the wilderness. When our finitude presses in on us, technology comes as the Tempter, promising us that we will be able to provide for all our needs, that we will be capable of great feats without paying the consequences, that we can rule the world, if only we give ourselves over to it. Most if not all of us who have faced the temptation have failed.

So, Jesus comes in the first instance to liberate these captives, the possessed. Only in a secondary sense do the poor need to be saved - saved from the unnecessary harm inflicted on them by the possessed, who are able to break every

---

1122 Ibid.
1123 Although we cannot know how ironic he was being, Jesus is often quoted as saying that his ministry had a limited scope, to the lost (Luke 19:10), and to those who are sick (Matthew 9:12; Mark 2:17; Luke 5:31-32).
chain used to bind them. Yet both rich and poor participate in their salvation. The rich must renounce their possession and fill their lives with relationships, so as to leave no room for repossession. The poor participate in their salvation through resistance. Through asserting their equality by turning the other cheek.

For technology is not immortal or unassailable. It too is subject to “natural” selection. Some hosts seem to develop a level of immunity and resist reinfection. If they group together this enhances their level of immunity. Pieces of technology also require resources for survival which their host does not: oil, silicone, plastics and metals. Like most organisms, as technologies multiply they diminish the resources on which they depend for survival, especially since their hosts practice little recycling and thus the “dead” cannot be broken down and reused. Some resources are by definition unrecyclable, like oil. It is far from clear that there is an alternative energy source sufficient to allow technology to spread over the whole globe, or even persist at current levels in existing populations. The wars amongst its hosts which are beginning to occur to secure the survival of technology (think oil rich Kuwait and Iraq, and even East Timor) may paradoxically, by greatly diminishing the number of hosts, and by engaging technology in competition with itself, significantly reduce the amount of technology in the future. Through war and the undermining of their resources, large technological societies repeatedly sow the seeds of their own destruction, creating a breathing space for those who have retained the memory needed to survive off the land in low tech ways, and managed to remain isolated from the conflict.

This is one apocalyptic vision we have often been presented with - a post World War III Earth in which small groups of humans eke out a living with a greatly diminished technological capacity. Whether the post apocalyptic generation would be any better at using technology differently is doubtful, and the whole cycle may repeat itself a few hundred or thousand years hence until Earth witnesses another externally driven extinction event, such as an asteroid strike.

Or perhaps, now that we are so populous and travel so quickly, we will encounter a microbial pathogen which causes a massive population crash because we are
unable to find a cure. Unlike wars and asteroids, this would greatly reduce human numbers without the associated devastation of the ecosystems around us, and would surely be the preferred option for any other species able to reflect on it, not to mention the God who values all of these species.

One thing is certain, human population growth will not continue at the present rate for long, and it will almost certainly be curtailed spectacularly. There is little short term hope that we will avoid this fate. In the long term, of course, our passing is inevitable. Biocentric theology has no hope for humanity, and does not need one, at least not a hope of prevailing. Although fears of a present apocalypse obsess us at times\textsuperscript{1124} and we fill books in the attempt to avoid it, the whole Earth will experience a final, inevitable apocalypse four billion years from now. We will not prevail.

Fortunately, Jesus does not call us to prevail. The motivation for forming small communities of technology resistant humans should not be to prevail. Hope of prevailing is the desire to create a system which works, which is victorious, but Jesus has called us to do what is right, not what works. He calls us to embrace death in order to enjoy life while we have it. True hope exists in the fact that our evolutionary origins bequeath us the desire for intimacy and autonomy, a quest for meaning in which we can continue to love and be loved, to apprehend God and life even as it crumbles around us. A hope that the image of God, both as likeness and as relationship, continues around us, and after us, and will be resurrected after we are gone, whether our exit is induced by rich humans or external factors. A hope that, in the meantime, our actions might preserve some of this image, both for the future and for ourselves now, and most especially for the God who called the whole glorious mess into being in the first place.

Here, then, is a brief recapitulation of a sketch of an ethic which Christian biocentric communities might use to live out their hope.

\textsuperscript{1124}Catherine Keller, \textit{New Forward to Apocalypse Now and Then} (unpublished manuscript: 2004), p. 1. Keller’s forward, partly in response to email discussion we had, makes the point that although there is an inevitable apocalypse in the very far future, most of us are concerned to address the more immediate threat of a human initiated one.
10.8 A Biocentric ethic – a brief sketch

- It would not be a conservation ethic, since we know that life is not static. What has been, and what is now, is not what should be.
- It would be an evolutionary ethic, but not an ‘improvement’ ethic. There is no anthropotelism or consciousness-telism. What will exist is not better than what has existed.
- Though consciousness is not the end point or goal of life, it is nonetheless significant. When decisions about the treatment of persons need to be made, their level of consciousness will be a factor, though not always the controlling one. Likewise for judgments about a person’s moral responsibilities, which depends not on their species, but their capacity.
- Rather than seeing their ethical vision as a battle against their evolutionary past, it would look to clues from this past in understanding where, why and how their vision might be enhanced.
- It would seek to promote God’s richness of experience, primarily through promoting rich relationships amongst its members and all life. The good life is the life which enriches the experience of God, both experience through life forms and experience of them and their relationships. Though no life form is sacred and irreplaceable, all are valuable.
- It would appreciate that these relationships come and go, as all of life is in a state of flux. It would need to rethink how the relationships of community members, including sexual relationships and marriages, fit into that.
- Since all of life is the image of God, and a lens through which we encounter God, then Schweitzer’s reverence for life will provide a fruitful source of reflection, though his horror at the process of natural selection and death would need to be addressed.
- It would accept that the world in which it lives is neither benign nor malevolent, and that its survival relies on the exploitation of life around it, and resisting being exploited to some extent.

---

• It would see human “disability” as diversity of experience, making the people with disabilities at least potentially more valuable to God than the multitudes of able bodied and minded people with their relatively more homogenous experience.

10.9 Summary

My thesis is that there is no ontological discontinuity between human beings and the rest of life on Earth. Further, the goal of evolution is not the production of Homo sapiens, or even of conscious life. Indeed, there is no scientifically discernable goal in evolution; it is a process without meaningful trends even though, necessarily, there is an overall increase in complexity.\textsuperscript{1126}

Christian theology, then, must speculate on why God created the world in the context of this negative conclusion from science about evolution’s teleology. The traditional belief, that God desired something to love, is consonant with, though not derivable from, the scientific data. Process theology says that God created the universe to have rich experiences, but this must be separated from its very consciousness-telic understanding of life. Every part of the diverse expressions of life on Earth, past present and future, add to God’s richness of experience, primarily though enhancing the richness of relationships amongst organisms, and between organisms and God, since God relates directly to and through all life, and has experiences of all life.\textsuperscript{1127}

God’s mission, then, was simply creation. It is to relate to and through creation. Biocentric theology affirms God as creator, but rejects those paradigms which claim that God somehow directed the course of biological evolution, or even the development of the universe. God wanted life, not any particular form of life. God has no particular career goals for the kids.

\textsuperscript{1126} Life must necessarily have been extraordinarily simple when it began, and therefore could only get more complex. The various reasons for this increase in complexity, such as the survival advantages of multicellularity and sexual reproduction, have already been discussed.

\textsuperscript{1127} I accept the point common to process theology and other philosophical systems which reject an ontological discontinuity between life and non-life, but have decided not to pursue this in this thesis. It is a sufficient challenge to argue that humans are in continuity with all life.
On Earth, the image of life cannot be limited to *Homo sapiens*. Neither can it be sorted into some kind of hierarchy, mostly because of the theological objection to the divisions this would create within *Homo sapiens*. Outright rejection of any concept of the image of God has some merit, since God has not manipulated life on Earth. Yet that would imply that life has no relationship with God. So biocentric theology affirms that life is the image of God. Life as a pulsing, flowing whole. This is consonant with the elements of the science story which point us beyond boundaries: whether of species or even individuals.

The Christian claim that God is Trinity cannot be limited to the androcentric description of God as Father, Son and Holy Spirit. Even the anthropocentric addition of Mother is insufficient. Rather, biocentric theology affirms the underlying claims which Trinitarian theology makes about God; that God is beyond us, became one with us, and remains among and within us. The God who transcends us and exists apart from us is nonetheless in relationship with us - having become one of us and remaining amongst and even within us. Surprisingly, in biocentrism God becoming one of us means God becoming *human*, though God amongst us refers to all life.

From the theological claim that all life is the image of God flows the theological expectation that all life will exercise dominion on Earth. This makes good sense of the ecological data. This dominion is expressed, so science tells us, predominantly in competition for resources, either by individuals or by temporary cooperatives. This dominion includes the evolutionary past and the ecological present, it involves creating life and taking it. Scientifically, Earth is neither benign nor malevolent, and theologically we declare it all to be good. Also theologically, we conclude that all life participates in the mission of God: the enhancement of God’s richness of experience, whether consciously or not.

If life is the image of God, exercising dominion for God, and participating in the mission of God, then it makes sense to speak of all life as part of the family of God. At a minimum, following Whitehead, this family of persons includes all creatures with some consciousness. Given the image of God I am proposing,
personhood cannot be limited to individual consciousness. A person is someone that has relationships, and all life has a relationship with God and with other life. There is no more need to rank people than there was to rank the image of God. Indeed, it would have the same theological peril.

Jesus of Nazareth comes to us through the Christian tradition as another image of God, often seen to be a unique image of God amongst humans. Or perhaps a unique image of the God-human. Paradoxically, the more ecotheologians try to affirm the rest of life on Earth by giving the incarnation in Jesus cosmic or Earthly significance, the less biocentric they become, often implying that there is something fundamentally wrong with life on Earth that needs to be redeemed or rescued.

The biocentric theology I am proposing, instead affirms death and pain and suffering as good parts of creation, not evidence of its fallenness. Jesus therefore has no direct role in life beyond humanity - there is nothing there to save. Jesus’ mission was to enhance God’s richness of experience of Earth. To promote life. We hear strong echoes of this in the gospels, the Christ who came that we might have life, and have it in abundance. Yet we do not hear Jesus telling us to escape death, rather he calls us to embrace it in order to live. It may be that his mission is to save those who have succumbed to an overwhelming fear of death, who through trying to save their lives are actually already dead. He especially seems to have targeted those who try to buffer themselves from finitude through their wealth, arguing that nobody can follow him unless they give away all they have. Free from wealth, from technology, they are then reengaged with life, and thus the image of God and indeed God. The biophilia hypothesis suggests that this depth of relationship and the psychological health it brings is only available to those who engage with the Wild Other. Jesus, then, came to save humans back into creation, not out of it or even with it. We are not called to save Earth through being good stewards, but, if anything, by returning to being plain members of the Earth community.

1128 Unless, of course, they have come to fear death to the extent that it is preventing them participating in life. But then we would expect that they would experience an incarnation of God appropriate to them, which certainly would not be Jesus.
Having helped us embrace our biological death, has the incarnation also somehow won us a non biological life afterwards? Is there a heaven? While there is nothing in biocentric theology which definitely excludes this, I have not come across any vision of this heaven which makes sense. It is hard to see how, should we enter into a non-biological existence, we could remain in any way recognisably ourselves. Perhaps there is an afterlife where we somehow exist in the memory of God, but this is a very different image from the personal resurrection traditionally envisaged in Christianity, and especially from the bodily resurrection apparently expected in the biblical witnesses. It would also be a completely deterministic afterlife, where our every action was determined by God’s imagination. Finally, it is difficult to see how we could remain ourselves divorced from the finitude which so shapes who we are and what we do.

If there was no bodily resurrection, no life after death, then what do we make of The Resurrection - that central Christian symbol? If it is not meant literally\textsuperscript{1129}, as many theologians have claimed\textsuperscript{1130}, what does it mean biocentrically? To me it carries strong parallels to the evolutionary process, if we take a God’s eye perspective. Following the death of species comes the resurrection of new ones. These species are somewhat continuous with the old (for they are genetically related) but are nevertheless something altogether new. Not all evolution has this resurrection quality, but at the level of punctuations, and especially mass extinctions, we see life “dying” only to be raised again in new forms. Hope for a species, even the human species, is not for the sort of eternal life won through invincibility but through resurrection.

Here we begin to come full circle. I pointed out previously that the Basis of Union also talks about the Kingdom of God, the final eschatological event, as something which belongs to this world, rather than some new heavenly existence. Resurrection is mentioned only once, and that is Jesus’ resurrection. For

\textsuperscript{1129} It could be literal in biocentric thinking, but the challenge is to work out what it would mean if it isn’t.

\textsuperscript{1130} Reviewed, for example, in Peter Carnley, The Structure of Resurrection Belief (Oxford, [Oxfordshire]: Clarendon Press, 1993).
everything else the *Basis* anticipated consummation. How much consonance is there between the *Basis* and the biocentric theology I am proposing? Of course the *Basis* is not actually biocentric, but we notice some interesting trajectories when we re-read it through a biocentric lens. I have argued that biocentric Christianity is consonant with science without being derivable from it. Has it remained consonant with the *Basis*, without claiming to be derived from it? Is the pursuit of a biocentric faith a valid preoccupation for a minister of the Uniting Church, or are they at such cross purposes that one or the other must be abandoned?

10.10 **Reading the *Basis of Union* biocentrically**

In the first section, the *Basis* talks of God’s desire for salvation for all people. I have argued that this salvation is primarily salvation from the chronic fear of finitude which prevents us entering into the abundant life which God desires for all people. I have speculated that this life denying fear is confined to *Homo sapiens*, and not even to all of us. This fear leads some humans to inflict harm on others, who are then saved in a secondary sense, by being relieved of this harm through the transformation of those who are overwhelmed by fear. At the end of section one the *Basis* declares that the church

> “... awaits with hope the day of the Lord Jesus Christ on which it will be clear that the kingdom of this world has become the kingdom of our Lord and of the Christ, who shall reign for ever and ever.”

This reiterates the very this-worldly emphasis of the *Basis* which I highlighted in chapter 6.2, and of the biocentric theology I am proposing. This-worldly salvation is primarily directed at the rich, possessed by technology, and only secondarily to the poor persons who suffer as a result. It is a salvation which returns all persons to the finitude filled cycles of exploitation and domination.

In section two the Uniting Church is located within the unity of the whole Church, and it commits itself to recognising unity amidst great diversity. Hear the ecological echoes. We know ecologically that unity is not found in uniformity, but enormous diversity, connected by a common (genetic) inheritance. So, when
the Uniting Church commits itself to transcending cultural, economic, national and racial boundaries, biocentric thought sees a trajectory which eventually transcends the species boundary itself, locating Uniting Church members not just within the unified diversity of the Church, but of life itself. While the Basis strives for union, biocentric thought acknowledges that it already exists.

In section three the Basis reflects on the person and work of Christ, claiming that he was given by God to take away the world’s sin. Since we have rejected the traditional views of the Fall, what do we make of the “world’s sin,” and it being taken away? Firstly, God loving and Jesus taking away the sin of the “world” is a synonym for humanity in the relevant biblical witnesses, rather than literally meaning all creation\textsuperscript{1131}, and this is probably the sense in which the Basis intends it. This would reflect the reforming and evangelical traditions, which emphasise the more existential experience of sin: the sense of incompleteness, discord and broken relationships which are seen to demonstrate the separation of humans from God and thus each other.

Adding our biocentric reflections, Jesus may be thought of as coming to take away the sense of discord amongst humans, which results from being overwhelmed by the fear of finitude and death. Jesus, then, offers atonement for those humans who need it. Through the exorcism of technology/fear of death comes at-one-ment with life and the God of life. The barrier to atonement is not God’s rejection of a relationship with the human because of their sinfulness, but the human’s fearful rejection of God’s life. This is quite different from traditional ideas of, for example, propitiatory or substitutionary atonement. Nevertheless, since the Basis deliberately withholds from speculating on the way in which atonement works\textsuperscript{1132}, this biocentric atonement is not at odds with the Basis.

\textsuperscript{1131} Predominantly in the gospel and epistles attributed to John.

\textsuperscript{1132} Even the chair of EMU in Victoria admits that the Basis does not enter into detail on this point, though he clearly wishes it did (Walter Abetz and Katherine Abetz, “Substitutionary Atonement,” in \textit{Swimming between the Flags}, ed. Walter Abetz and Katherine Abetz (Bendigo: Middle Earth Press, 2002), p. 47.)
The *Basis* goes on to say that salvation results from the trust in God as Father which comes through the work of the Spirit, given to all people. The salvation Jesus brings is, we are told, the work of God alone. How humbling. We have no role in salvation. Compared to this, the realisation that we have not been entrusted to control the ecosystems of the planet as stewards or servants is a minor disappointment.

When the *Basis* says that the Spirit was given to all people, biocentric thinking assumes that this encompasses much more than human beings. Here again we extend something hinted at in the *Basis* itself, for it goes on to call Jesus both Lord of the Church and head over *all things* - the beginning of a new creation and a new humanity. By mentioning both *separately* it displays its anthropocentric paradigm\textsuperscript{1133}, but by mentioning both, it nonetheless links the two.

So what is the Church? A Church, *Ecclesia* in Greek, is literally a gathering, often with a sense of being called. The *Basis* says that Church is the “[community] of the Holy Spirit.” Christian tradition, even anthropocentric versions, also acknowledges that the Holy Spirit has a relationship with all creation. God is in communion with all of life, so life is the community of the Holy Spirit. The Church is the community of the Holy Spirit. Life is the community of the Holy Spirit. Life is the Church, the Earth Church, the gathering called by God to relationship with God. Within the Earth Church *Homo sapiens* makes up a recent denomination, admittedly with many sub denominations within it. Humans are the Baptists of the Earth Church\textsuperscript{1134}.

We are now well beyond the boundaries imagined by the authors of the *Basis*, but still I believe on a tangent which can legitimately be read in their text. Let us continue to read the *Basis* for a moment as members of the Earth Church.

\textsuperscript{1133} It also reveals its ecclesiocentrism when it states that only people in the *Church* have been given the Holy Spirit.

\textsuperscript{1134} The same connection can be made by linking the human church as the body of Christ (sections three and seven) to the Earth as the Body of God, a line pursued so influentially by Sallie McFague, though I have not emphasised it particularly in this thesis. A hint of this is found in the Commission on Faith and Order, which in 1985 described the church as, “… an opening into the vast ‘living body’ of God’s creation as a whole, altogether destined for liberation and rebirth.” (cited in Dutney, ”Creation and the Church,” p. 54.)
Section three goes on to tell us of the, “…coming reconciliation and renewal which is the end in view for the whole creation.” By end it means not just purpose, but end-point, since the paragraph goes on to talk about a final consummation. But in a world not fallen into sin or corruption, what does reconciliation mean, or renewal? It cannot mean renewal to a pre-human Eden where there is no pain or death. Here again the idea that Jesus came to save humans back into creation, back into their acceptance of finitude and especially death, sheds some light.

To the extent that humans accept their finitude and escape the control of fear, they are reconciled to their place in creation. We would imagine that should this occur, the short term result would be a dramatic reduction in resource consumption, land clearance and the like, which would allow for a renewal of the ecosystems around us, and the diversity of life they contain.

Thus the human Church, which is,

“… a fellowship of reconciliation [returning humans to their proper place in life], a body within which the diverse gifts of its members are used for the building up of the whole, an instrument through which Christ may work and bear witness to himself…”

is but a component of the Earth Church, which was created,

“To be a community\(^\text{1135}\) of reconciliation [open ecological relationships], a body within which the diverse [evolved] characteristics of its members result in the building up of the whole [pulse of life] which bears witness as the image of God.”

The description of the human Church as a community comprised of diverse members in relationship with each other is thoroughly ecological\(^\text{1136}\). This

\(^{1135}\) “Community” has a less blokey feel than “fellowship.”

\(^{1136}\) Dutney recognised the appropriateness of the ecological metaphor for the church in the mid eighties (Dutney, Manifesto for Renewal, p. 140- footnote 7.) A decade later Granberg-Michaelson used ecology as a paradigm for ecumenical theology (Granberg-Michaelson, "Creation in Ecumenical Theology," p. 104.)
ecological metaphor is echoed in the description of the relationships between diverse gifts and ministries in section thirteen.

This ecological model is followed by a decided evolutionary one when the Basis calls the Church a *pilgrim people*, always on the way [evolving] toward a promised goal. There is no suggestion in the Basis that the human church of 1977 is any better than that of 1000, or even 30. There is no suggestion of the liberal doctrine of gradual improvement; so we can imagine an echo of the evolution of life, which has no teleology but to exist in relationship to God and enrich God’s experience as it does so. When Christians claim to be on a pilgrimage, then, this does not alienate us from the rest of life, or relegate it to a backdrop on which our adventure occurs. Rather, it reminds us how much we are a part of life on Earth, as we saw suggested earlier in World Environment Day 2001.

The second allusion to pilgrimage, which comes at the end of the Basis, sounds similarly evolutionary. It is the practical application of section 11, which acknowledged the need for theology to be free to mutate into fresh confessions of the Lord in response to new environments. Section seventeen therefore commits to mutating its laws in response to new environments, and section eighteen accepts the need for constant correction (evolution) as it continues toward the promised end. What is this end? We could consider it to be the time at which humans are reconciled to their finitude filled place in the world. Yet this is not guaranteed. Even if it did happen, life and evolution would not then stand still. Since the Basis believes that the end is promised, we might equate it with the end promised by the sciences, the consummation of life in the final, total death of the planet in approximately four billion years time.

The Basis reminds us of the serious duty of reading the scriptures, with the help of scholarly interpretation as outlined in section eleven. In this context, biocentric theology recognises not only the androcentrism and classism which scholars have identified in the biblical witnesses and their interpreters, but also anthropocentrism. Like feminism, it finds it possible to retrieve minority voices

---

1137 Chapter 6.2.12.
which critique the dominant ideology. It also accepts the need to add theological construction to this retrieval. The minority voices do not say all that needs to be said. The same approach must be taken to the creeds, which will need, as the Basis itself admits, to be reinterpreted in this new biocentric age. Likewise the Reformation Witnesses, who will need to be understood to have been addressing only the humans, with our need to be again and again reminded of grace, the centrality of Christ, and the need for constant appeal to the scriptures.

Finally, the sacraments. Baptism, which initiates us into the Christian pilgrimage, and the eucharist, which sustains us on the journey. As discussed in chapter 6.2.5, Healing the Earth proposed some novel ways of imagining the eucharistic nature of Earth, which would have far reaching implications for our theology and worship life if adopted. Healing claims that the elements of the eucharist are actually gifts of God for all creation, not just humans and far less the Christians gathered to drink and eat them. This has considerable consonance with the idea that humans are not the only persons. Biocentric theology, however, initially reverses the direction of gift giving in the eucharist. If all Earth is eucharist, then the eucharist is first a gift to Christ. Without Earth there would be no Jesus of Nazareth. The Earth eucharist enabled Jesus to come and share his eucharist with all people.

Since life is the Church, then we might see the human Church, when it celebrates the eucharist, as remembering the Great Eucharist in which it is constantly called to participate. The good gift - the death that brings life. We might see the broken body and poured out blood not only as reminding us of the death of Christ, but the life giving death which surrounds us every day, all the broken and bleeding bodies which make up our world, and which we will become. Healing was correct in identifying the eucharist as a gift to all creation, or all persons, but this was bound up in the assumption that all creation is fallen. Yet salvation is pictured not as an afterlife for all beings, but the reconciliation of

---

1138 Many of us, of course, already have broken bodies in various ways. Here I am thinking of the really broken, i.e. decomposing.
humans and “nature.” It is open to the interpretation that the eucharist is primarily a gift for those humans who need to be reminded that only by engaging in finitude, in brokenness, can they engage in life, in wholeness. Those already so engaged receive ongoing encouragement, and secondarily a greater chance to participate in the fullness of life, now that those saved from fear have made more room for them. So the eucharist is both a converting ordinance for those too afraid of finitude to enter life, and a sustaining ordinance for those people already on the journey. This implies, of course, that the restriction of the eucharist to humans is an artificial discrimination.

Death brings to mind funerals, which would become part of our eucharistic celebrations as we celebrate the end of a life to make way for new life.

New life. Baptism. The Basis talks specifically about baptism into Christ’s body. This is a specifically human baptism, since Christ came primarily for humans (or some of us). It is the means by which fearful humans accept the call to participate in “Christ’s life and mission in the world.” The result is that they will be, “… united in one community of love, service, suffering and joy, in one family of the [God] of all in heaven and earth, and in the power of the one Spirit.”

So baptism is for humans, but it is baptism into the one family of God, the Earth Church. The baptised are those who have, through being saved from the fear of death, returned to the Earth Church from which they became estranged. In what can be read biocentrically as a rejection of consciousness-telism, baptism is made available not only to those able to actively confess their faith, but even to infants who have no idea what is happening. Nurtured in the finitude affirming community around them, the church prays that they may grow up without experiencing the estrangement from which some adult converts are drawn to repent1139.

---

1139 I mean repent literally, as in the decision to turn around, rather than speculating on the morality of the convert.
Baptism into Christ’s body, then, initiates people into the human Church, but this is not an end in itself. It is for their salvation, to save them from the fear of death and awaken them to their place in the finitude filled pulse of life, so that they might have this life abundantly. So that they might delight in, and contribute to the image of God in which they are immersed.
11 Appendices

11.1 Appendix 1, Basis of Union, 1992

HEADINGS have been added to each section of this printing of the Basis of Union for ease of reference but do not form part of the Basis of Union approved by the Churches.

1. THE WAY INTO UNION

The Congregational Union of Australia, the Methodist Church of Australasia and the Presbyterian Church of Australia, in fellowship with the whole Church Catholic, and seeking to bear witness to that unity which is both Christ's gift and will for the Church, hereby enter into union under the name of the Uniting Church in Australia. They pray that this act may be to the glory of God the Father, the Son and the Holy Spirit. They give praise for God's gifts of grace to each of them in years past; they acknowledge that none of them has responded to God's love with a full obedience; they look for a continuing renewal in which God will use their common worship, witness and service to set forth the word of salvation for all people. To this end they declare their readiness to go forward together in sole loyalty to Christ the living Head of the Church; they remain open to constant reform under his Word; and they seek a wider unity in the power of the Holy Spirit. In this union these Churches commit their members to acknowledge one another in love and joy as believers in our Lord Jesus Christ, to hear anew the commission of the Risen Lord to make disciples of all nations, and daily to seek to obey his will. In entering into this union the Churches concerned are mindful that the Church of God is committed to serve the world for which Christ died, and that it awaits with hope the day of the Lord Jesus Christ on which it will be clear that the kingdom of this world has become the kingdom of our Lord and of the Christ, who shall reign for ever and ever.

2. OF THE WHOLE CHURCH

The Uniting Church in Australia lives and works within the faith and unity of the One Holy Catholic and Apostolic Church. The Uniting Church recognises that it is related to other Churches in ways which give expression, however partially, to that unity in faith and mission. Recalling the Ecumenical Councils of the early centuries, the Uniting Church looks forward to a time when the faith will be further elucidated, and the Church's unity expressed, in similar Councils. It thankfully acknowledges that the uniting Churches were members of the World Council of Churches and other ecumenical bodies, and will seek to maintain such membership. It remembers the special relationship which obtained between the several uniting Churches and other Churches of similar traditions, and will continue to learn from their witness and be strengthened by their fellowship. It is encouraged by the existence of United Churches in which these and other traditions have been incorporated, and wishes to learn from their experience. It believes that Christians in Australia are called to bear witness to a unity of faith and life in Christ which transcends cultural and economic, national and racial boundaries, and to this end the
Uniting Church commits itself to seek special relationships with Churches in Asia and the Pacific. The Uniting Church declares its desire to enter more deeply into the faith and mission of the Church in Australia, by working together and seeking union with other Churches.

3. BUILT UPON THE ONE LORD JESUS CHRIST

The Uniting Church acknowledges that the faith and unity of the Holy Catholic and Apostolic Church are built upon the one Lord Jesus Christ. The Church preaches Christ the risen crucified
One and confesses him as Lord to the glory of God the Father. In Jesus Christ "God was reconciling the world to himself" (2 Corinthians 5:19 RSV). In love for the world, God gave the Son to take away the world's sin.

Jesus of Nazareth announced the sovereign grace of God whereby the poor in spirit could receive God's love. Jesus himself, in his life and death, made the response of humility, obedience and trust which God had long sought in vain. In raising him to live and reign, God confirmed and completed the witness which Jesus bore to God on earth, reasserted claim over the whole of creation, pardoned sinners, and made in Jesus a representative beginning of a new order of righteousness and love. To God in Christ all people are called to respond in faith. To this end God has sent forth the Spirit that people may trust God as their Father, and acknowledge Jesus as Lord. The whole work of salvation is effected by the sovereign grace of God alone.

The Church as the fellowship of the Holy Spirit confesses Jesus as Lord over its own life; it also confesses that Jesus is Head over all things, the beginning of a new creation, of a new humanity. God in Christ has given to all people in the Church the Holy Spirit as a pledge and foretaste of that coming reconciliation and renewal which is the end in view for the whole creation. The Church's call is to serve that end: to be a fellowship of reconciliation, a body within which the diverse gifts of its members are used for the building up of the whole, an instrument through which Christ may work and bear witness to himself. The Church lives between the time of Christ's death and resurrection and the final consummation of all things which Christ will bring; the Church is a pilgrim people, always on the way towards a promised goal; here the Church does not have a continuing city but seeks one to come. On the way Christ feeds the Church with Word and Sacraments, and it has the gift of the Spirit in order that it may not lose the way.

4. CHRIST RULES AND RENEWS THE CHURCH

The Uniting Church acknowledges that the Church is able to live and endure through the changes of history only because its Lord comes, addresses, and deals with people in and through the news of his completed work. Christ who is present when he is preached among people is the Word of God who acquits the guilty, who gives life to the dead and who brings into being what otherwise could not exist. Through human witness in word and action, and in the power of the Holy Spirit, Christ reaches out to command attention and awaken faith; he calls people into the fellowship of his sufferings, to be the disciples of a
crucified Lord; in his own strange way Christ constitutes, rules and renews them as his Church.

5. THE BIBLICAL WITNESSES

The Uniting Church acknowledges that the Church has received the books of the Old and New Testaments as unique prophetic and apostolic testimony, in which it hears the Word of God and by which its faith and obedience are nourished and regulated. When the Church preaches Jesus Christ, its message is controlled by the Biblical witnesses. The Word of God on whom salvation depends is to be heard and known from Scripture appropriated in the worshipping and witnessing life of the Church. The Uniting Church lays upon its members the serious duty of reading the Scriptures, commits its ministers to preach from these and to administer the sacraments of Baptism and the Lord's Supper as effective signs of the Gospel set forth in the Scriptures.

6. SACRAMENTS

The Uniting Church acknowledges that Christ has commanded his Church to proclaim the Gospel both in words and in the two visible acts of Baptism and the Lord's Supper. Christ himself acts in and through everything that the Church does in obedience to his commandment: it is Christ who by the gift of the Spirit confers the forgiveness, the fellowship, the new life and the freedom which the proclamation and actions promise; and it is Christ who awakens, purifies and advances in people the faith and hope in which alone such benefits can be accepted.

The Uniting Church acknowledges that Christ incorporates people into his body by Baptism. In this way Christ enables them to participate in his own baptism, which was accomplished once on behalf of all in his death and burial, and which was made available to all when, risen and ascended, he poured out the Holy Spirit at Pentecost. Baptism into Christ's body initiates people into Christ's life and mission in the world, so that they are united in one fellowship of love, service, suffering and joy, in one family of the Father of all in heaven and earth, and in the power of the one Spirit. The Uniting Church will baptise those who confess the Christian faith, and children who are presented for baptism and for whose instruction and nourishment in the faith the Church takes responsibility.

8. HOLY COMMUNION

The Uniting Church acknowledges that the continuing presence of Christ with his people is signified and sealed by Christ in the Lord's Supper or the Holy Communion, constantly repeated in the life of the Church. In this sacrament of his broken body and outpoured blood the risen Lord feeds his baptised people on their way to the final inheritance of the Kingdom. Thus the people of God, through faith and the gift and power of the Holy Spirit, have communion with their Saviour, make their sacrifice of praise and thanksgiving, proclaim the Lord's death, grow together into Christ, are strengthened for their participation in the mission of Christ in the world, and rejoice in the foretaste of the Kingdom which Christ will bring to consummation.
9. CREEDS

The Uniting Church enters into unity with the Church throughout the ages by its use of the confessions known as the Apostles' Creed and the Nicene Creed. The Uniting Church receives these as authoritative statements of the Catholic Faith, framed in the language of their day and used by Christians in many days, to declare and to guard the right understanding of that faith. The Uniting Church commits its ministers and instructors to careful study of these creeds and to the discipline of interpreting their teaching in a later age. It commends to ministers and congregations their use for instruction in the faith, and their use in worship as acts of allegiance to the Holy Trinity.

10. REFORMATION WITNESSES

The Uniting Church continues to learn of the teaching of the Holy Scriptures in the obedience and freedom of faith, and in the power of the promised gift of the Holy Spirit, from the witness of the Reformers as expressed in various ways in the Scots Confession of Faith (1560), the Heidelberg Catechism (1563), the Westminster Confession of Faith (1647), and the Savoy Declaration (1658). In like manner the Uniting Church will listen to the preaching of John Wesley in his Forty-Four Sermons (1793). It will commit its ministers and instructors to study these statements, so that the congregation of Christ's people may again and again be reminded of the grace which justifies them through faith, of the centrality of the person and work of Christ the justifier, and of the need for a constant appeal to Holy Scripture.

11. SCHOLARLY INTERPRETERS

The Uniting Church acknowledges that God has never left the Church without faithful and scholarly interpreters of Scripture, or without those who have reflected deeply upon, and acted trustingly in obedience to, God's living Word. In particular the Uniting Church enters into the inheritance of literary, historical and scientific enquiry which has characterised recent centuries, and gives thanks for the knowledge of God's ways with humanity which are open to an informed faith. The Uniting Church lives within a world-wide fellowship of Churches in which it will learn to sharpen its understanding of the will and purpose of God by contact with contemporary thought. Within that fellowship the Uniting Church also stands in relation to contemporary societies in ways which will help it to understand its own nature and mission. The Uniting Church thanks God for the continuing witness and service of evangelist, of scholar, of prophet and of martyr. It prays that it may be ready when occasion demands to confess the Lord in fresh words and deeds.

12. MEMBERS

The Uniting Church recognises and accepts as members all who are recognised as members of the uniting Churches at the time of union. Thereafter membership is open to all who are baptised into the Holy Catholic Church in the name of the Father and of the Son and of the Holy Spirit. The Uniting Church will seek ways in which the baptised may
have confirmed to them the promises of God, and be led to deeper commitment to the faith and service into which they have been baptised. To this end the Uniting Church commits itself to undertake, with other Christians, to explore and develop the relation of baptism to confirmation and to participation in the Holy Communion.

13. GIFTS AND MINISTRIES

The Uniting Church affirms that every member of the Church is engaged to confess the faith of Christ crucified and to be his faithful servant. It acknowledges with thanksgiving that the one Spirit has endowed the members of Christ's Church with a diversity of gifts, and that there is no gift without its corresponding service: all ministries have a part in the ministry of Christ. The Uniting Church, at the time of union, will recognise and accept the ministries of those who have been called to any task or responsibility in the uniting Churches. The Uniting Church will thereafter provide for the exercise by men and women of the gifts God bestows upon them, and will order its life in response to God's call to enter more fully into mission.

14. MINISTERS, ELDERS, DEACONESSES AND LAY PREACHERS

The Uniting Church, from inception, will seek the guidance of the Holy Spirit to recognise among its members women and men called of God to preach the Gospel, to lead the people in worship, to care for the flock, to share in government and to serve those in need in the world.

To this end:

(a) The Uniting Church recognises and accepts as ministers of the Word all who have held such office in any of the uniting Churches, and who, being in good standing in one of those Churches at the time of union, adhere to the Basis of Union. This adherence and acceptance may take place at the time of union or at a later date. Since the Church lives by the power of the Word, it is assured that God, who has never failed to provide witness to that Word, will, through Christ and in the power of the Holy Spirit, call and set apart members of the Church to be ministers of the Word. These will preach the Gospel, administer the sacraments and exercise pastoral care so that all may be equipped for their particular ministries, thus maintaining the apostolic witness to Christ in the Church. Such members will be called Ministers and their setting apart will be known as Ordination.

The Presbytery will ordain by prayer and the laying on of hands in the presence of a worshipping congregation. In this act of ordination the Church praises the ascended Christ for conferring gifts upon men and women. It recognises Christ's call of the individual to be his minister; it prays for the enabling power of the Holy Spirit to equip the minister for that service. By the participation in the act of ordination of those already ordained, the Church bears witness to God's faithfulness and declares the hope by which it lives. In company with other Christians the Uniting Church will seek for a renewed understanding of the way in which the congregation participates in ordination and of the significance of ordination in the life of the Church.
(b) The Uniting Church recognises and accepts as elders or leaders those who at the time of union hold the office of elder, deacon or leader appointed to exercise spiritual oversight, and who, being in good standing in any of the uniting Churches at the time of union, adhere to the Basis of Union. It will seek to recognise in the congregation those endowed by the Spirit with gifts fitting them for rule and oversight. Such members will be called Elders or Leaders.

(c) The Uniting Church recognises and accepts as deaconesses those who at the time of union are deaconesses in good standing in any of the uniting Churches and who adhere to the Basis of Union. It believes that the Holy Spirit will continue to call women to share in this way in the varied services and witness of the Church, and it will make provision for this. Such members will be called Deaconesses.

The Uniting Church recognises that at the time of union many seek a renewal of the diaconate in which women and men offer their time and talents, representatively and on behalf of God's people, in the service of humanity in the face of changing needs. The Uniting Church will so order its life that it remains open to the possibility that God may call men and women into such a renewed diaconate: in these circumstances it may decide to call them Deacons and Deaconesses, whether the service is within or beyond the life of the congregation.

(d) The Uniting Church recognises and accepts as lay preachers those who at the time of union are accredited lay preachers (local preachers) in any of the uniting Churches and who adhere to the Basis of Union. It will seek to recognise those endowed with the gift of the Spirit for this task, will provide for their training, and 'will gladly wait upon that fuller understanding of the obedience of Christians which should flow from their ministry. Such members will be called Lay Preachers.

In the above sub-paragraphs the phrase "adhere to the Basis of Union" is understood as willingness to live and work within the faith and unity of the One Holy Catholic and Apostolic Church as that way is described in this Basis. Such adherence allows for difference of opinion in matters which do not enter into the substance of the faith.

The Uniting Church recognises that the type and duration of ministries to which women and men are called vary from time to time and place to place, and that in particular it comes into being in a period of reconsideration of traditional forms of the ministry, and of renewed participation of all the people of God in the preaching of the Word, the administration of the sacraments, the building up of the fellowship in mutual love, in commitment to Christ's mission, and in service of the world for which he died.

15. GOVERNMENT IN THE CHURCH

The Uniting Church recognises that responsibility for government in the Church belongs to the people of God by virtue of the gifts and tasks which God has laid upon them. The Uniting Church therefore so organises its life that locally, regionally and nationally government will be entrusted to representatives, men and women, bearing the gifts and graces with which
God has endowed them for the building up of the Church. The Uniting Church is governed by a series of inter-related councils, each of which has its tasks and responsibilities in relation both to the Church and the world.

The Uniting Church acknowledges that Christ alone is supreme in his Church, and that he may speak to it through any of its councils. It is the task of every council to wait upon God's Word, and to obey God's will in the matters allocated to its oversight. Each council will recognise the limits of its own authority and give heed to other councils of the Church, so that the whole body of believers may be united by mutual submission in the service of the Gospel.

To this end the Uniting Church makes provision in its constitution for the following:

(a) The Congregation is the embodiment in one place of the One Holy Catholic and Apostolic Church, worshipping, witnessing and serving as a fellowship of the Spirit in Christ. Its members meet regularly to hear God's Word, to celebrate the sacraments, to build one another up in love, to share in the wider responsibilities of the Church, and to serve the world. The congregation will recognise the need for a diversity of agencies for the better ordering of its life in such matters as education, administration and finance.

(b) The Elders' or Leaders' Meeting (the council within a congregation or group of congregations) consists of the minister and those who are called to share with the minister in oversight. It is responsible for building up the congregation in faith and love, sustaining its members in hope, and leading them into a fuller participation in Christ's mission in the world.

(c) The Presbytery (the district council) consists of such ministers, elders/leaders and other Church members as are appointed thereto, the majority of elders/leaders and Church members being appointed by Elders'/Leaders' Meetings and/or congregations, on a basis determined by the Synod. Its function is to perform all the acts of oversight necessary to the life and mission of the Church in the area for which it is responsible, except for those agencies which are directly responsible to the Synod or Assembly. It will in particular exercise oversight over the congregations within its bounds, encouraging them to strengthen one another's faith, to bear one another's burdens, and exhorting them to fulfil their high calling in Christ Jesus. It will promote those wider aspects of the work of the Church committed to it by the Synod or Assembly.

(d) The Synod (the regional council) consists of such ministers, elders/leaders and other Church members as are appointed thereto, the majority being appointed by Presbyteries, Elders'/Leaders' Meetings or congregations, on a basis determined by the Assembly. It has responsibility for the general oversight, direction and administration of the Church's worship, witness and service in the region allotted to it, with such powers and authorities as may from time to time be determined by the Assembly.

(e) The Assembly (the national council) consists of such ministers, elders/leaders and other Church members as are appointed thereto, the majority being appointed by the Presbyteries and Synods. It has determining responsibility for matters of doctrine, worship, government and discipline, including the promotion of the Church's mission, the establishment of standards of theological training and reception of ministers from other communions, and the taking of further measures towards the wider union of the Church. It makes the guiding decisions on the tasks and authority to be exercised by other councils. It is obligatory for it to seek the concurrence of the councils, and on occasion of the congregations of the Church, on matters of vital importance to the life of the Church.
The first Assembly, however, will consist of members of the uniting Churches, appointed in equal numbers by them in such manner as they may determine, and is vested with such powers as may be necessary to establish the Uniting Church according to the provisions of the Basis of Union.

Until such time as councils other than the Assembly can be established, the Uniting Church recognises and accepts the various agencies for the discharge of responsibility which are in existence in the uniting Churches. It invites any such continuing bodies immediately to enter a period of self-examination in which members are asked to consider afresh their common commitment to the Church's mission and their demonstration of its unity. The Uniting Church prays that God will enable them to order their lives for these purposes.

16. PARTICULAR FUNCTIONS

The Uniting Church recognises the responsibility and freedom which belong to councils to acknowledge gifts among members for the fulfilment of particular functions. The Uniting Church sees in pastoral care exercised personally on behalf of the Church an expression of the fact that God always deals personally with people, would have God's loving care known among people, and would have individual members take upon themselves the form of a servant.

17. LAW IN THE CHURCH

The Uniting Church acknowledges that the demand of the Gospel, the response of the Church to the Gospel, and the discipline which it requires are partly expressed in the formulation by the Church of its law. The aim of such law is to confess God's will for the life of the Church; but since law is received by human beings and framed by them, it is always subject to revision in order that it may better serve the Gospel. The Uniting Church will keep its law under constant review so that its life may increasingly be directed to the service of God and humanity, and its worship to a true and faithful setting forth of, and response to, the Gospel of Christ. The law of the Church will speak of the free obedience of the children of God, and will look to the final reconciliation of humanity under God's sovereign grace.

18. THE PEOPLE OF GOD ON THE WAY

The Uniting Church affirms that it belongs to the people of God on the way to the promised end. The Uniting Church prays that, through the gift of the Spirit, God will constantly correct that which is erroneous in its life, will bring it into deeper unity with other Churches, and will use its worship, witness and service to God's eternal glory through Jesus Christ the Lord. Amen.
11.2 Appendix 2,  
Statement to the  
Nation, inaugural  
Assembly, June,  
1977

People of the Congregational, Methodist  
and Presbyterian Churches have united.  
A new church has been born.

We, who are members of the first  
Assembly of the Uniting Church in  
Australia address the people of Australia  
in this historic moment. The path to  
unity has been long and at times  
difficult, but we believe this unity is a  
sign of the reconciliation we seek for the  
whole human race.

We acknowledge with gratitude that the  
churches from which we have come  
have contributed in various ways to the  
life and development of this nation. A  
Christian responsibility to society has  
always been regarded as fundamental to  
the mission of the Church. In the  
Uniting Church our response to the  
Christian gospel will continue to involve  
us in social and national affairs.

We are conscious of our responsibilities  
within and beyond this country. We  
particularly acknowledge our  
responsibilities as one branch of the  
Christian church within the region of  
South-East Asia and the Pacific. In these  
contexts we make certain affirmations at  
the time of our inauguration.

We affirm our eagerness to uphold basic  
Christian values and principles, such as  
the importance of every human being,  
the need for integrity in public life, the  
proclamation of truth and justice, the  
rights for each citizen to participate in  
decision-making in the community,  
religious liberty and personal dignity,  
and a concern for the welfare of the  
whole human race.

We pledge ourselves to seek the  
correction of injustices wherever they  
occur. We will work for the eradication  
of poverty and racism within our society  
and beyond. We affirm the rights of all  
people to equal educational  
opportunities, adequate health care,  
freedom of speech, employment or  
dignity in unemployment if work is not  
available. We will oppose all forms of  
discrimination which infringe basic  
rights and freedoms.

We will challenge values which  
emphasise acquisitiveness and greed in  
disregard of the needs of others and  
which encourage a higher standard of  
living for the privileged in the face of  
the daily widening gap between the rich  
and poor.

We are concerned with the basic human  
rights of future generations and will urge  
the wise use of energy, the protection of  
the environment and the replenishment  
of the earth's resources for their  
use and enjoyment.

Finally we affirm that the first allegiance  
of Christians is God, under whose  
judgment the policies and actions of all  
nations must pass. We realise that  
sometimes this allegiance may bring us  
into conflict with the rulers of our day.  
But our Uniting Church, as an institution  
within the nation, must constantly stress  
the universal values which must find  
expression in national policies if  
humanity is to survive.

We pledge ourselves to hope and work  
for a nation whose goals are not guided  
by self-interest alone, but by concern for  
the welfare of all persons everywhere —  
the family of the One God — the God  
made known in Jesus of Nazareth the  
One who gave His life for others.  
In the spirit of His self-giving love we  
seek to go forward.
11.3 Appendix 3,
Statement to the Nation, Australian Bicentennial Year, 1988

In this country which has been inhabited for 40,000 years, the Australian nation is celebrating the Bicentennial of the first European settlement. The Uniting Church, now in its second decade, greets our fellow Australian citizens on this occasion.

We give thanks for those times when the Australian society has established justice, equality, and mutual respect among people; has placed care for the people who have least above sectional interests; has welcomed new migrants and refugees; has exercised solidarity and friendship in times of crisis in Australia across divisions of race and culture; and has engaged constructively with the peoples of Asia, the Pacific and the rest of the world as peacemaker.

In the last two centuries the movements of history have brought together here in one nation, people of diverse cultures. As a church which is itself composed of people of many cultures and races, both Aboriginal and migrant, we rejoice in the vision of a multicultural society where these peoples may live together in unity and diversity, maintaining different cultural traditions, yet forging a common destiny based on commitment to the ideals of equality of opportunity, tolerance, justice and compassion.

At the same time, those of us who have migrated to Australia in the last two centuries or are the descendants of migrants, confess that all of us are beneficiaries of the injustices that have been inflicted on those of us who were Aboriginal people. In varying degrees, we all contribute to, and perpetuate those injustices. We recognise the violence which has been done to the Aboriginal people in the colonisation of this continent and the injustice by which Aborigines have been deprived of the land. We recognise the continuing Aboriginal experience of violence and injustice.

The integrity of our nation requires truth; the history of Australia, as it is taught in educational institutions or popularised in the media, must cease to conceal the reality and nature of Aboriginal society before invasion, what was done to them in colonisation, and what has been the fate and status of Aborigines within the Australian nation.

The integrity of our nation will be measured by action; by legislative action which honours the Aboriginal plea for justice, and by popular action by which the Australian people express their willingness to support Aboriginal Australians in the quest for justice and their struggle to reconstruct their society.

As for the Uniting Church in Australia, in obedience to God, in concern for the integrity of our nation, and in co-operation with all citizens of goodwill, we Aboriginal and newer Australians have determined to stand together.

In co-operation with all fellow Australians of goodwill, we are committed to work for justice and peace, calling for honesty and integrity, encouraging tolerance and compassion, challenging acquisitiveness and greed, opposing discrimination and prejudice, condemning violence and oppression.
and creating a loving and caring community.

We are conscious of conflicts and tensions within the nation and the world. We deplore the divisions of humanity along racial, cultural, political, economic, sexual and religious lines. In obedience to God, we struggle against all systems and attitudes which set person against person, group against group, or nation against nation.

We recognise a widening gap between the rich and the poor, not only within Australia, but within the whole human community. We will strive to uphold the rightful claims of the poor on the resources of this nation and the world. We will seek to identify and challenge all social and political structures and all human attitudes which perpetuate and compound poverty.

We affirm our belief that the natural world is God's creation; good in God's eyes, good in itself, and good in sustaining human life. Recognising the vulnerability of the life and resources of creation, we will work to promote the responsible management, use and occupation of the earth by human societies. We will seek to identify and challenge all structures and attitudes which perpetuate and compound the destruction of creation.

As a Christian church, born out of the struggles of Australian Christians to live in obedience to God in Australia, we find hope in Jesus Christ. We recognise that we Australian people are of diverse faiths and cultures and our desire is that we live together here in one community in justice, peace and mutual respect.

May the peace of God be with us all.
Sir Ronald Wilson, President
Rev. David Gill, General Secretary

91.14.18 The Assembly resolved to adopt the resolution on the rights of nature and the rights of future generations:

We believe that God, the Creator, upholds human dignity. God has created the human in the divine image. No human authority can take away or contest the dignity thus bestowed upon the human.

We believe that God has blessed humanity and that God’s faithfulness endures from generation to generation.

We believe that God loves the divine creation and wills the development of its life. No creature is indifferent in the eyes of God. Each has its dignity and thereby also its right to existence.

The Holy Scriptures attest to God’s covenant with the creation. “Behold, I establish my covenant with you and your descendants after you and with every living creature” (Genesis 9:9-10).

In view of the fact that this promise is today being undermined by human lack of moderation,

- we affirm the inalienable dignity of all humans and call for the recognition and guarantee of human rights throughout the world,
- we express the conviction that those who live today share responsibility for the ability of future generations to live in dignity,
- we support the attribution of rights not only to humans but also to nature, God’s creation, and
- we reject the view that animate and inanimate nature are mere objects which stand at the arbitrary disposal of the human.

We call upon the churches to make room for God’s covenant with creation within the realm of law by committing themselves at all levels to recognition of the following “Rights of Future Generations” and “Rights of Nature”.

11.4.1 A. Rights of Future Generations

Future generations have a right to life.

Future generations have a right to an unmanipulated human genetic inheritance, that is, a genetic inheritance not artificially altered by humans.

Future generations have a right to a rich plant and animal world, and thereby a right to a life within an abundant nature and to the preservation of multifarious genetic resources.

Future generations have a right to healthy air, to an intact ozone layer, and to the sufficient thermal exchange between the earth and space.

Future generations have a right to clean and sufficient waters, and, in particular, healthy and sufficient drinking water.
Future generations have a right to healthy and fertile soil and to healthy woodland.

Future generations have right to substantial reserves of non-(or only very slowly) renewable raw materials and energy sources.

Future generations have the right not to be confronted with products and wastes of earlier generations that threaten their health or require excessive expense for protection and control.

Future generations have a right to “cultural inheritance”, that is, to an encounter with the culture created by earlier generations.

Future generations have in general a right to physical living conditions that allow them a humanly dignified existence. In particular, they have a right not to be forced to accept physical alterations deliberately produced by their predecessors that inordinately restrict their individual and collective self-determination in cultural, economic, political, or social respects.

11.4.2 B. Rights of Nature

Nature — animate or inanimate — has a right to existence, that is, to preservation and development.

Nature has a right to the protection of its eco-systems, species, and populations in their interconnectedness.

Animate nature has a right to the preservation and development of its genetic inheritance.

Organisms have a right to a life fit for their species, including procreation within their appropriate ecosystems.

Disturbances of nature require a justification. They are only permissible

- when the presuppositions of the disturbance are determined in a democratically legitimate process and with respect of the rights of nature,
- when the interests of the disturbance outweigh the interests of a complete protection of the rights of nature, and
- when the disturbance is not inordinate. Damaged nature is to be restored whenever and wherever possible.

Rare ecosystems, and above all those with an abundance of species, are to be placed under absolute protection. The driving of species to extinction is forbidden.

We appeal to the United Nations to develop a new Declaration which explicitly protects the rights mentioned above. Simultaneously, we appeal to the individual nations to incorporate these rights into their constitutions and legislation.
